Normal Forms

CS460 Databases for Data Scientists

Outline

- Features of *good* Relational design

- Atomic domains and first normal form

- Decomposition using functional dependencies
  - 2nd normal form
  - 3rd normal form
  - Boyce Codd normal form

- Decomposition using multi-valued dependencies
  - 4th normal form

- 5th normal form

- 6th normal form

- Extreme Case

The Normalization Process

- Iteratively improve the database design
  - Rule out non-atomic values
  - Eliminate redundancies

- Iterations
  - Move database design from one normal form to the next

- In each iteration
  - The design is changed (usually: smaller, but more relations)
  - Some typical problems are eliminated

> *Interviewer: Where did "normalization" come from?*
>
> **Codd:** It seemed to me essential that some discipline be introduced into database design. I called it normalization because then President Nixon was talking a lot about normalizing relations with China. I figured that if he could normalize relations, so could I.

The Normalization Process

- Levels of normalization based on the amount of redundancy in the database

- Various levels of normalization are:
  - First Normal Form (1NF)
  - Second Normal Form (2NF)
  - **Third Normal Form (3NF)**
  - **Boyce-Codd Normal Form (BCNF)**
  - Fourth Normal Form (4NF)
  - Fifth Normal Form (5NF)
  - Domain Key Normal Form (DKNF)

Less Redundancy

Better Consistency

More Tables

Higher Complexity
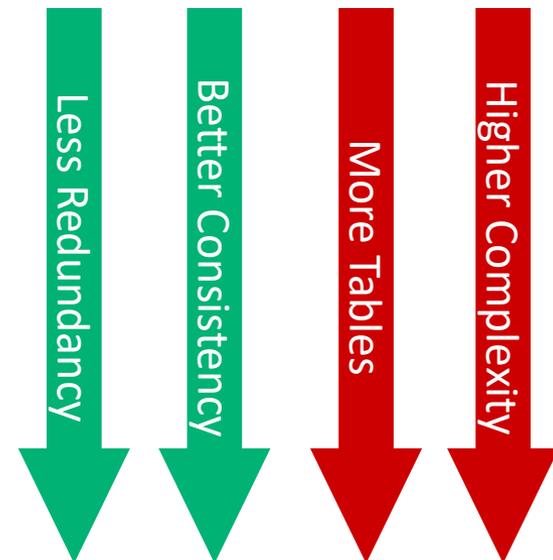

First Normal Form

(1NF)

Atomicity

- Consider the following relation

ID	Name	Instructor	Programs
CS-101	Introduction to Computer Science	Melanie Smith	CS, DS, Math
CS-205	Introduction to Databases	Mark Johnsson	DS, Soc
CS-374	Data Mining	Mark Johnsson	CS, DS, Soc
MA-403	Linear Algebra	Mary Williams	Math, CS
…	…	…	…

In which programs can the course be taken

- Task:
  - Find all courses in the DS program

Atomicity

- Find all courses in the DS program
  - Requires processing all the strings of the *Programs* attribute
  - String processing is expensive

- Notion of **atomicity**:
  - Attribute is *atomic* (also: *scalar*) if its values are considered to be indivisible units
  - Examples of non-atomic attributes
    - Set-valued attributes (like *Programs*)
    - Composite attributes (like *Instructor*)
    - Identification numbers like CS-101 that can be broken up into (meaningful) parts

Atomicity

- In the database, all values, also strings, are considered indivisible

- SQL queries will only return strings
  - e.g., "CS-101" or "CS, DS, Math, CE"

- If we further analyze them
  - Extract department "CS" from "CS-101"
  - Find program "DS" in "CS, DS, Math, CE"

- … we move the semantics from the database to the application logic!

First Normal Form

- Definition: A relational schema R is in **first normal form** if the domains of all attributes of R are atomic

- Rationale: Non-atomic values
  - complicate storage and encourage redundant storage of data
  - complicate processing of complex attributes
  - move data semantics to processing code

- From here on, we assume all relations are in first normal form

First Normal Form - Decomposition

- Replace composite attributes by single attributes

ID	Name	Instructor	Programs
CS-101	Introduction to Computer Science	Melanie Smith	CS, DS, Math
...	...	...	...

ID_dept	ID_no	Name	Instructor_first	Instructor_last
CS	101	Introduction to Computer Science	Melanie	Smith
...		...	...	...

First Normal Form - Decomposition

multi-attribute key

- Replace multi-valued attributes by a new relation

ID	Name	Instructor	Programs
CS-101	Introduction to Computer Science	Melanie Smith	CS, DS, Math
...	...	...	...

ID_dept	ID_no	Name	Instructor_first	Instructor_last
CS	101	Introduction to Computer Science	Melanie	Smith
...		...	...	...

ID_dept	ID_no	Program
CS	101	CS
CS	101	DS
CS	101	Math
...	...	...

- before: R= (ID, ..., mva)
- after: R = (ID, ...), R_{mva} = (ID, mva)

11

Second Normal Form

(2NF)

Functional Dependencies

- Functional dependencies
  - are a means to identify potential redundancies
  - also: a means to identify primary keys

- Definition:
  - If one set of attributes A determines another set of attributes B
  - Then B is functionally dependent on A

- Less formal:
  - If we know A, we also know B

Functional Dependencies

- Consider the example below
- The course ID (two parts) determine
  - The course name
  - The instructor
- Functional dependency:
  - {ID_dept, ID_no} → {Name, Instructor_first, Instructor_last}

ID_dept	ID_no	Name	Instructor_first	Instructor_last
CS	101	Introduction to Computer Science	Melanie	Smith
CS	205	Introduction to Databases	Mark	Johnsson
CS	374	Data Mining	Mark	Johnsson
MA	403	Linear Algebra	Mary	Williams
…		…	…	…

Functional Dependencies

- Note:
  - Functional dependencies are not only determined from the data
  - But the domain knowledge

- Example: by chance, each instructor teaches only one course
  - {Instructor_first, Instructor_last} → {ID_dept, ID_no, Name}

ID_dept	ID_no	Name	Instructor_first	Instructor_last
CS	101	Introduction to Computer Science	Melanie	Smith
CS	205	Introduction to Databases	Mark	Johnsson
CS	374	Data Mining	John	Stevens
MA	403	Linear Algebra	Mary	Williams
...		...	...	...

True vs. False Functional Dependencies

- Functional dependencies in the data may be true or false
  - Given domain knowledge
- E.g., looking at the table below
  containing exactly those five entries
- What do you think about
  - {ID_no} → {First name, Last name, Birthday, Social Sec. No.}
  - {First name, Last name} → {ID_no, Birthday, Social Sec. No.}
  - {Birthday} → {ID_no, First name, Last name, Social Sec. No.}

ID_no	First name	Last name	Birthday	Social Sec. No.
101	Melanie	Smith	1991-12-05	457384723
102	Mark	Johnsson	1993-07-18	342789347
103	Mark	Stevens	1992-01-05	091238302
104	Mary	Smith	1991-12-04	123749123

Towards the Second Normal Form

- Assume we have the following relation
  - The department is represented by *ID_dept* as part of the course ID
  - ...and in fully written form in the *Department* attribute

- Suppose we insert the tuple

  (CS, 102, Mathematics, Programming)

- → We can create an inconsistency!

ID_dept	ID_no	Department	Name
CS	101	Computer Science	Introduction to Computer Science
CS	205	Computer Science	Introduction to Databases
CS	374	Computer Science	Data Mining
MA	403	Mathematics	Linear Algebra
...			...

Second Normal Form

- A relation is in second normal form if
  - It is in first normal form, and
  - All *nonkey* attributes are functionally dependent on the *entire* primary key

- Functional dependencies:
  {ID_dept, ID_no} → {Name},
  {ID_dept} → {Department}

> **Violation**
> Department only
> Depends on part of
> the primary key!

ID_dept	ID_no	Department	Name
CS	101	Computer Science	Introduction to Computer Science
CS	205	Computer Science	Introduction to Databases
CS	374	Computer Science	Data Mining
MA	403	Mathematics	Linear Algebra
...			...

Non-keys

18

Second Normal Form

- A relation is in second normal form if
  - It is in first normal form, and
  - All *nonkey* attributes are functionally dependent on the *entire* primary key

> **Violation**
> Department only Depends on part of the primary key!
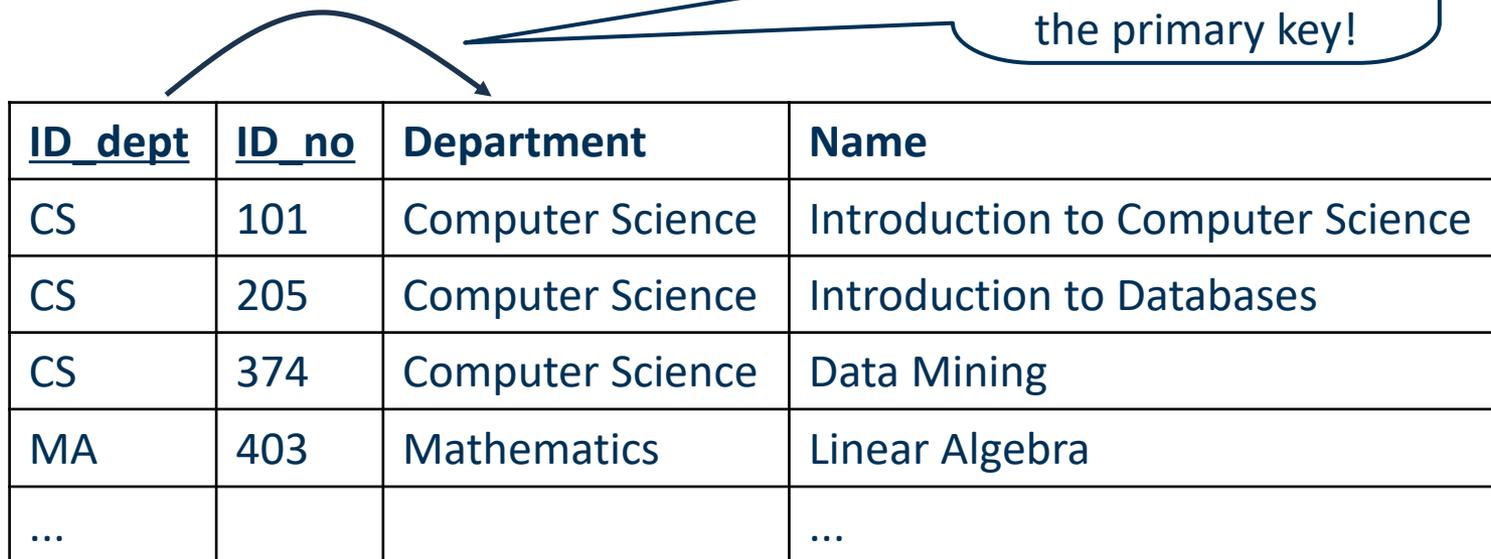

ID_dept	ID_no	Department	Name
CS	101	Computer Science	Introduction to Computer Science
CS	205	Computer Science	Introduction to Databases
CS	374	Computer Science	Data Mining
MA	403	Mathematics	Linear Algebra
...			...

Decomposition to Second Normal Form

- Determine the primary key PK of a relation R

- Write down all functional dependencies for the relation

- For each FD A → B, where A ⊂ PK
  - Create a new Relation RB (A,B)
  - Remove B from R
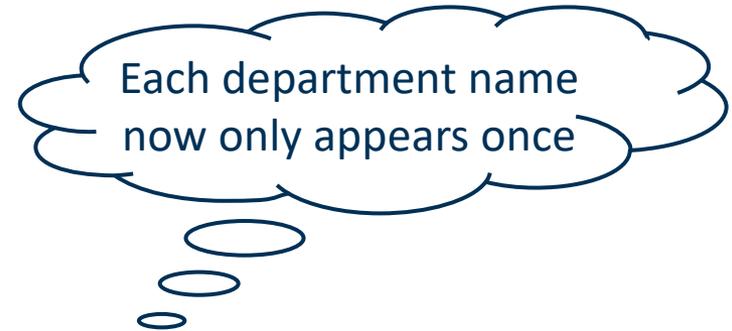

Each department name now only appears once

ID_dept	ID_no	Name
CS	101	Introduction to Computer Science
CS	205	Introduction to Databases
CS	374	Data Mining
MA	403	Linear Algebra
…	…	…

ID_dept	Department
CS	Computer Science
MA	Mathematics
…	…

Decomposition to Second Normal Form

- Original problem:
  we could create an inconsistency by inserting
  (CS, 102, Mathematics, Programming)
- This is no longer possible: we cannot insert
  (CS, Mathematics)
- into
  (<u>ID_dept</u>, Department)

why?

<u>ID_dept</u>	<u>ID_no</u>	Name
CS	101	Introduction to Computer Science
CS	205	Introduction to Databases
CS	374	Data Mining
MA	403	Linear Algebra
…	…	…

<u>ID_dept</u>	Department
CS	Computer Science
MA	Mathematics
…	…

Lossless Join Decomposition

- Each decomposition should be lossless join
  - i.e., a natural join should reconstruct the original table
  - Consider the (wrong) example below
    - ID_dept is omitted from the first relation
  - Natural join creates cross product of both relations!

ID_no	Name
101	Introduction to Computer Science
205	Introduction to Databases
374	Data Mining
403	Linear Algebra
…	…

ID_dept	Department
CS	Computer Science
MA	Mathematics
…	…

Third Normal Form

(3NF)

Further Dependencies in Relations

- Assume we had another attribute in our relation
  - i.e., the personnel ID of the instructor (**Instr_ID**)
- Can you create an inconsistency?
  - Suppose we inserted
    - (CS, 379, Web Mining, 143970, Steven, Smith)

ID_dept	ID_no	Name	Instr_ID	Instructor_first	Instructor_last
CS	101	Introduction to Computer Science	143273	Melanie	Smith
CS	205	Introduction to Databases	143970	Mark	Johnsson
CS	374	Data Mining	143970	Mark	Johnsson
MA	403	Linear Algebra	141784	Mary	Williams
…		…		…	…

Further Dependencies in Relations

- Observation A: this relation is in 2NF

> Still, inconsistent inserts are possible
  - It is is 1NF
  - All *nonkey* attributes are functionally dependent on the *entire* primary key
    - {ID_dept, ID_no} → {Name, Instr_Id, Instr_first, Instr_last} holds
    - There is no non-key attribute a for which {ID_dept} → {a} or {ID_no} → {a} holds

ID_dept	ID_no	Name	Instr_ID	Instructor_first	Instructor_last
CS	101	Introduction to Computer Science	143273	Melanie	Smith
CS	205	Introduction to Databases	143970	Mark	Johnsson
CS	374	Data Mining	143970	Mark	Johnsson
MA	403	Linear Algebra	141784	Mary	Williams
...		...		...	...

Further Dependencies in Relations

- Observation B: there is a second functional dependency
  - {Instr_ID} → {Instr_first, Instr_last}

ID_dept	ID_no	Name	Instr_ID	Instructor_first	Instructor_last
CS	101	Introduction to Computer Science	143273	Melanie	Smith
CS	205	Introduction to Databases	143970	Mark	Johnsson
CS	374	Data Mining	143970	Mark	Johnsson
MA	403	Linear Algebra	141784	Mary	Williams
…		…		…	…

Third Normal Form

- **Definition**: **Third Normal Form**
  - Relation is in 2NF, and
  - No attribute is *transitively dependent* on the primary key

ID_dept	ID_no	Name	Instr_ID	Instructor_first	Instructor_last
CS	101	Introduction to Computer Science	143273	Melanie	Smith
CS	205	Introduction to Databases	143970	Mark	Johnsson
CS	374	Data Mining	143970	Mark	Johnsson
MA	403	Linear Algebra	141784	Mary	Williams
...	...			...	...

Third Normal Form: Decomposition

- Identify transitive dependency in R
  - PK $\rightarrow$ A and A $\rightarrow$ B
- Create new relation $R_A(\underline{A}, B)$
- Remove from B from R

New relation!

ID_dept	ID_no	Name	Instr_ID
CS	101	Introduction to Computer Science	143273
CS	205	Introduction to Databases	143970
CS	374	Data Mining	143970
MA	403	Linear Algebra	141784
...		...	

Instr_ID	Instructor_first	Instructor_last
143273	Melanie	Smith
143970	Mark	Johnsson
141784	Mary	Williams
	...	...

Third Normal Form: Decomposition

- Result: the new relations are now in 3NF

- There is no transitive dependency in R
  - {Name} → {Instr_ID} and {Instr_ID} → {Name} do not hold

- There is no transitive dependency in the new relation
  - {Instr_first} → {Instr_last} and {Instr_last} → {Instr_first} do not hold

ID_dept	ID_no	Name	Instr_ID
CS	101	Introduction to Computer Science	143273
CS	205	Introduction to Databases	143970
CS	374	Data Mining	143970
MA	403	Linear Algebra	141784
...		...	

Instr_ID	Instructor_first	Instructor_last
143273	Melanie	Smith
143970	Mark	Johnsson
141784	Mary	Williams
	...	...

Third Normal Form: Decomposition

- Initial problem: inconsistent insert

   (CS, 379, Web Mining, 143970, Steven, Smith)

- Now, inserting

   (143970, Steven, Smith)

   into the new relation is no longer possible!

ID_dept	ID_no	Name	Instr_ID
CS	101	Introduction to Computer Science	143273
CS	205	Introduction to Databases	143970
CS	374	Data Mining	143970
MA	403	Linear Algebra	141784
...		...	

Instr_ID	Instructor_first	Instructor_last
143273	Melanie	Smith
143970	Mark	Johnsson
141784	Mary	Williams
	...	...

Boyce-Codd Normal Form

(BCNF)

(slightly stricter version of 3 NF
thus also called 3.5NF)

Dependencies between Candidate Keys

- Superkeys and candidate keys:
  - K is a superkey for relation schema R if and only if K $\rightarrow$ R
  - K is a candidate key for R if and only if
    - K $\rightarrow$ R, and
    - there is no K' $\subset$ K with K' $\rightarrow$ R
  - There may be more than one candidate key
    - Each one may be equally well picked as a primary key

Superkeys

Candidate Keys

Primary Key
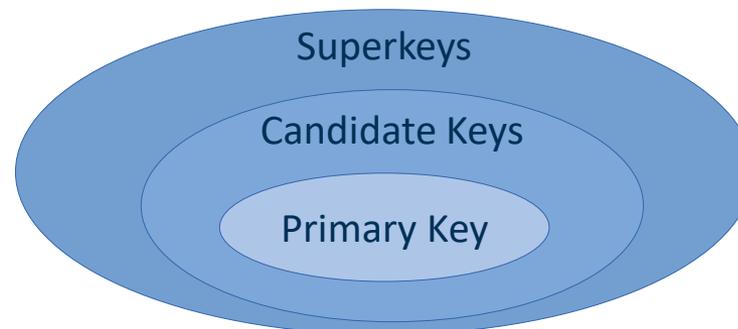

Dependencies between Candidate Keys

- Assume the following scenario
  - Departments have (one or more) secretaries
  - Secretaries work for (one or more) departments
  - Each secretary may have one phone number per department s/he works for, or just one phone number for all
  - Secretaries' basic data (name etc.) have already been decomposed

Institute	Secr_ID	Phone
CS	0001	5073
CS	0002	5074
Soc	0001	6010
Soc	0003	6011
Eng	0003	6011
…	…	…

Dependencies between Candidate Keys

- Neither Institute, Secr_ID, nor Phone are a superkey
- This relation has two candidate keys
  - {Institute, Secr_ID}
  - {Institute, Phone}

sufficient to identify a unique tuple

Why not {Secr_ID, Phone}

Institute	Secr_ID	Phone
CS	0001	5073
CS	0002	5074
Soc	0001	6010
Soc	0003	6011
Eng	0003	6011
...	...	...

Dependencies between Candidate Keys

- With each candidate key as a primary key, the relation is in 3NF

- {Institute, Secr_ID}:

  same for {Institute, Phone}

  - {Institute, Secr_ID} - > {Phone}

  - Neither {Institute} → {Phone} nor {Secr_ID} → {Phone} holds

  - No transitive dependency

Institute	Secr_ID	Phone
CS	0001	5073
CS	0002	5074
Soc	0001	6010
Soc	0003	6011
Eng	0003	6011
…	…	…

Dependencies between Candidate Keys

- However, inconsistent inserts are still possible:
  - If **{Institute, Phone}** is chosen as the primary key
    - Inserting (CS, 0001, 5075), would mean
      "Two phone numbers for the same secretary and institute"

Institute	Secr_ID	Phone
CS	0001	5073
CS	0002	5074
Soc	0001	6010
Soc	0003	6011
Eng	0003	6011
…	…	…

Dependencies between Candidate Keys

- However, inconsistent inserts are still possible:
  - If **{Institute, Secr_ID}** is chosen as the primary key
    - Inserting (Soc, 0002, 6011), would mean
      "Same phone number for two secretaries in the same institute"

Institute	**Secr_ID**	**Phone**
CS	0001	5073
CS	0002	5074
Soc	0001	6010
Soc	0003	6011
Eng	0003	6011
…	…	…

Dependencies between Candidate Keys

- Observation: we have different functional dependencies here
  - {Institute, Secr_ID} → {Phone}
  - {Institute, Phone} → {Secr_ID}

- None of them violate the 3NF

- These are dependencies between different candidate keys

Institute	Secr_ID	Phone
CS	0001	5073
CS	0002	5074
Soc	0001	6010
Soc	0003	6011
Eng	0003	6011
…	…	…

Boyce-Codd Normal Form

- Definition: A relation is in Boyce-Codd Normal Form if
  - It is in 3NF
  - There is no functional dependency between attributes that belong to different candidate keys
    i.e., if CK → {a}, then a must not be part of a candidate key

- BCNF is equivalent to 3NF unless
  - A relation has two or more candidate keys
  - At least two of the candidate keys are composed of more than one attribute
  - The candidate keys are not disjoint,
    i.e., the composite candidate keys share some attributes

Decomposition to BCNF

- Create a single relation for each composite candidate key
- Place the remaining attributes (if any) in one of the relations
  - Based on their dependency

Institute	Secr_ID
CS	0001
CS	0002
Soc	0001
Soc	0003
Eng	0003
...	...

Institute	Phone
CS	5073
CS	5074
Soc	6010
Soc	6011
Eng	6011
...	...

Decomposition to BCNF

- Problem with inconsistent inserts:
  - (CS, 0001, 5075)
    - violates primary key constraint in left relation
  - (Soc, 0002, 6011)
    - violates primary key constraint in right relation

Two phone numbers for the same secretary and department

Same phone number for two secretaries in the same institute

Institute	Secr_ID
CS	0001
CS	0002
Soc	0001
Soc	0003
Eng	0003
…	…

Institute	Phone
CS	5073
CS	5074
Soc	6010
Soc	6011
Eng	6011
…	…

BCNF and Dependency Preservation

- We have lost some dependency during this decomposition

Institute	Secr_ID	Institute	Phone
CS	0001	CS	5073
CS	0002	CS	5074
Soc	0001	Soc	6010
Soc	0003	Soc	6011
Eng	0003	Eng	6011
...	...	...	...

Which phone no. belongs to which secretary?

BCNF and Dependency Preservation

- We have lost some dependency during this decomposition
- We could try to reintroduce it
  - e.g., add a third relation (Secr_ID, Phone)
  - but this would lead to new sources of inconsistencies

Institute	Secr_ID
CS	0001
CS	0002
Soc	0001
Soc	0003
Eng	0003
...	...

Institute	Phone
CS	5073
CS	5074
Soc	6010
Soc	6011
Eng	6011
...	...

Secr_ID	Phone
0001	5073
0002	5074
0001	6010
0003	6011
...	...

Decomposition to BCNF

- There are still inconsistencies that BCNF does not capture
  - e.g., inserting (Soc, 0002, 5074)
- This would be captured by the third relation
  - i.e., Secr_ID, Phone
  - but at the price of additional redundancies

Same phone number for two secretaries in different departments

Institute	Secr_ID
CS	0001
CS	0002
Soc	0001
Soc	0003
Eng	0003
...	...

Institute	Phone
CS	5073
CS	5074
Soc	6010
Soc	6011
Eng	6011
...	...

Secr_ID	Phone
0001	5073
0002	5074
0001	6010
0003	6011
...	...

Exercise

- Normalize this relation to BCNF

StudentID	Name	CourseID	CourseTitle	Unit	Abbr.
512874	Coen Piper	460	Database Technology	Data Science	DS
554867	Reilly Harvey	460	Database Technology	Data Science	DS
512874	Coen Piper	652	Data Security	Systems Engineering	SE
457214	Elina Burn	652	Data Security	Systems Engineering	SE

Fourth Normal Form

(4 NF)

How Good is BCNF/3NF?

- There are database schemas in BCNF that do not seem to be sufficiently normalized

- Consider a relation

    employee (ID, cost_center, phone)

- Where an employee may have more than one phone and can have multiple cost centers

ID	Cost Center	Phone
1000	10020	512-555-1234
1000	10030	512-555-1234
1000	10020	512-555-4321
1000	10030	512-555-4321

employee

How Good is BCNF/3NF?

- There are database schemas in BCNF that do not seem to be sufficiently normalized

- Functional dependency

    {ID} → {cost_center, phone}

- Superkey: {ID, cost_center, phone}

    – This would also be the primary key of the table

ID	**Cost Center**	**Phone**
1000	10020	512-555-1234
1000	10030	512-555-1234
1000	10020	512-555-4321
1000	10030	512-555-4321

employee

How Good is BCNF/3NF?

- There are database schemas in BCNF that do not seem to be sufficiently normalized

- Insertion anomaly:

  This looks odd

  – Suppose that an employee gets a new phone number

  – That would require one insert per cost center

  – Performing only some of those inserts would cause an anomaly

ID	Cost Center	Phone
1000	10020	512-555-1234
1000	10030	512-555-1234
1000	10020	512-555-4321
1000	10030	512-555-4321

employee

How Good is BCNF/3NF?

- There are database schemas in BCNF that do not seem to be sufficiently normalized

- It looks like decomposition into
(ID, Cost Center) and (ID, Phone)
would be a good idea
  - But BCNF does not suggest this
  - There is only one candidate key, i.e., {ID, Cost Center, Phone}

ID	**Cost Center**	**Phone**
1000	10020	512-555-1234
1000	10030	512-555-1234
1000	10020	512-555-4321
1000	10030	512-555-4321

employee

Fourth Normal Form

- Here, both Cost Center and Phone are multi-valued attributes
  - i.e., for each combination of ID and Cost Center, there are multiple values for Phone
  - same for combinations of ID and Phone

- Note: cost center and phone are independent from each other
  - i.e., neither {Cost Center} → {Phone} nor {Phone} → {Cost Center} holds

ID	Cost Center	Phone
1000	10020	512-555-1234
1000	10030	512-555-1234
1000	10020	512-555-4321
1000	10030	512-555-4321

employee

Fourth Normal Form

- **Definition**: A relation is in Fourth Normal Form if
  - it is in Boyce-Codd Normal Form
  - it does not contain more than one multi-valued attribute
    - in the sense that the multiple values are independent

ID	Cost Center	Phone
1000	10020	512-555-1234
1000	10030	512-555-1234
1000	10020	512-555-4321
1000	10030	512-555-4321

employee

Fourth Normal Form: Decomposition

- Decomposition algorithm:
  - Create a separate relation for each multi-valued attribute
  - Identify a suitable primary key

- Note: now we can safely insert a new phone number for an employee
  - Requires exactly one insert operation (as expected)
  - Does not lead to inconsistencies!

ID	Cost Center
1000	10020
1000	10030

ID	Phone
1000	512-555-1234
1000	512-555-4321

Fifth Normal Form

(5 NF)

Further Decompositions

- Consider the relation below
  - Each course is offered in different years
    - But there are additional constraints, e.g., Data Mining is only offered in the second semester
  - There might be different offerings in the same year by different lecturers
  - Although all of them are multi-valued, they are *not* independent

- Primary key: {Course, Inst_ID, Semester}

Course	Inst_ID	Semester
Introduction to Computer Science	13001	1st
Introduction to Computer Science	13001	2nd
Data Mining	15743	2nd
Data Mining	14233	2nd
Linear Algebra	14233	1st
…		

Further Decompositions

- Suppose we want to insert a third offering for data mining for the 2nd semester
  - But we do not know the instructor yet
- We cannot simply insert (Data Mining, null, 2nd)
  - Why?

Course	Inst_ID	Semester
Introduction to Computer Science	13001	1st
Introduction to Computer Science	13001	2nd
Data Mining	15743	2nd
Data Mining	14233	2nd
Linear Algebra	14233	1st
…		

Further Decompositions

- However, we could easily insert (Data Mining, 12874, 1st)
  - Although data mining is only offered for the 2nd semester
  - That knowledge is not explicit in the schema

Course	Inst_ID	Semester
Introduction to Computer Science	13001	1st
Introduction to Computer Science	13001	2nd
Data Mining	15743	2nd
Data Mining	14233	2nd
Linear Algebra	14233	1st
…		

Fifth Normal Form

- Also known as *project-join normal form (PJ/NF)*

- A relation is 5NF if
  - It is in 4NF, and
  - If it cannot be decomposed and re-joined based on the keys, without removing or adding information

Course	Inst_ID	Semester
Introduction to Computer Science	13001	1st
Introduction to Computer Science	13001	2nd
Data Mining	15743	2nd
Data Mining	14233	2nd
Linear Algebra	14233	1st
…		

Fifth Normal Form

- Decomposition into Fifth Normal Form
- For each PK with three values (A,B,C)
  - Try to decompose three relations (A,B), (B,C), (A,C)
  - Analyze whether their natural join is equivalent to (A,B,C)

Course	Inst_ID

Sixth Normal Form / Domain Key Normal Form

(6 NF / DKNF)

Sixth Normal Form (or Domain Key Normal Form)

- Generally:
    - A relation is in DKNF when there can be no insertion or deletion anomalies in the database
    - i.e., all constraints must be encoded in the database

- Consider the employee relation below
    - Additional constraint: students may not work more than 80h

ID	Type	Hours
10032	Lecturer	80
10432	Student	40
10483	Secretary	160
...	...	...

Sixth Normal Form
(or Domain Key Normal Form)

- Recap: domain of an attribute

  - can be used to define valid ranges

- Solution:

  - Decompose into individual relations by employee type

  - Impose domain constraint on attribute *S_Hours*

Lecturer_ID	**Hours**
10032	80
…	…

Secretary_ID	**Hours**
10483	160
…	…

Student_ID	**S_Hours**
10432	40
…	…

Intermediate Recap

- Levels of normalization based on the amount of redundancy in the database

- Various levels of normalization are:
  - First Normal Form (1NF)
  - Second Normal Form (2NF)
  - **Third Normal Form (3NF)**
  - **Boyce-Codd Normal Form (BCNF)**
  - Fourth Normal Form (4NF)
  - Fifth Normal Form (5NF)
  - Domain Key Normal Form (DKNF)

Less Redundancy | Better Consistency | More Tables | Higher Complexity
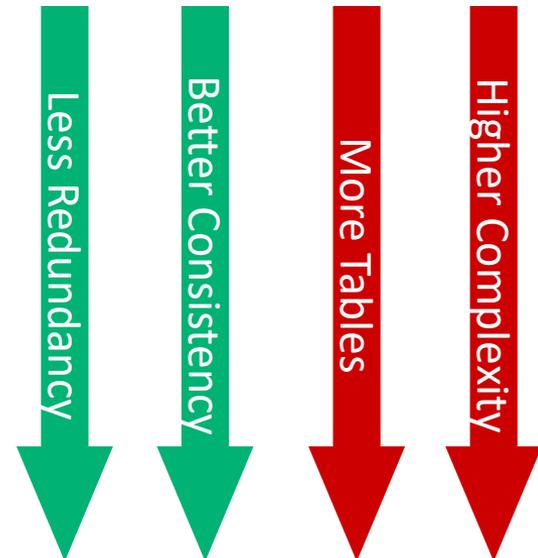

Incidental Denormalization

- Consider the relation below (courses and prerequisites)
  - Not normalized
  - Violates 2NF
    - Primary Key: {ID, Prereq_ID}
    - Functional Dependencies:
      - {ID} → {Name}
      - {Prereq_ID} → {Prereq_Name}

ID	Name	Prereq_ID	Prereq_Name
110	Data Mining	100	Databases
110	Data Mining	101	Programming
…	…	…	…

Incidental Denormalization

- Normalizing to 2NF breaks this into three tables
  - Now, displaying a list of courses with prerequisites requires two joins
  - Costly in terms of performance

- Not normalizing may be better in terms of performance
  - Alternative: materialized view

The same as (ID, Name), but normalization does not tell us

ID	Name
110	Data Mining
...	...

ID	Prereq_ID
110	100
110	101
...	...

Prereq_ID	Prereq_Name
100	Databases
101	Programming
...	...

Extreme Example

- **1NF**: find non-atomic attributes

ISBN 817525766-0

ISBN	Author	Title	Publisher	Year
978-0-857-52009-8	Stephen Baxter, Terry Pratchett	The Long Earth	Doubleday	2012
978-0-06-206777-7	Stephen Baxter, Terry Pratchett	The Long War	Harper	2013
978-0-575-07434-7	Alastair Reynolds	Absolution Gap	Gollancz	2003
...	...	...	...	...

Extreme Example

- 1NF: find non-atomic attributes
  - Break *ISBN* in parts (ISBN1, ISBN2, ISBN3, ISBN4, ISBN5)
  - Move *Author* to own relation
  - Break author's *Name* in parts

Two tables, because author is multi-valued

ISBN 817525766-0

9 788175 257665

ISBN1	ISBN2	ISBN3	ISBN4	ISBN5	Author_First	Author_Last
978	0	857	52009	8	Stephen	Baxter
978	0	857	52009	8	Terry	Pratchett
978	0	06	206777	7	Stephen	Baxter
						Pratchett
						Reynolds

ISBN1	ISBN2	ISBN3	ISBN4	ISBN5	Title	Publisher	Year
978	0	857	52009	8	The Long Earth	Doubleday	2012
978	0	857	52009	8	The Long War	Harper	2013
978	0	06	206777	7	Absolution Gap	Gollancz	2003
...	...	...	...	...	...	...	...

Extreme Example

- Functional dependencies on partial key
  - Relation book: publisher only depends on ISBN1, ISBN2, ISBN3
  - Violation of **2NF**

ISBN1	ISBN2	ISBN3	ISBN4	ISBN5	Author_First	Author_Last
978	0	857	52009	8	Stephen	Baxter
978	0	857	52009	8	Terry	Pratchett

ISBN1	ISBN2	ISBN3	ISBN4	ISBN5	Title	Publisher	Year	
978	0	857	52009	8	The Long Earth	Doubleday	2012	Baxter
978	0	857	52009	8	The Long War	Harper	2013	Pratchett
978	0	06	206777	7	Absolution Gap	Gollancz	2003	Reynolds
...	...	...	...	...	...	...	...	

Extreme Example

- Functional dependencies on partial key
  - Relation book: publisher only depends on ISBN1, ISBN2, ISBN3
  - Violation of **2NF**
  - Resolution: move publisher to own relation

ISBN1	ISBN2	ISBN3	ISBN4	ISBN5	Author_First	Author_Last
978	0	857	52009	8	Stephen	Baxter
978	0	857	52009	8	Terry	Pratchett
					ephen	Baxter
					rry	Pratchett

ISBN1	ISBN2	ISBN3	ISBN4	ISBN5	Title	Year
978	0	857	52009	8	The Long Earth	2012
978	0	857	52009	8	The Long Wa	
978	0	06	206777	7	Absolution C	
...	...	...	...	...	...	

ISBN1	ISBN2	ISBN3	Publisher
978	0	857	Doubleday
978	0	857	Harper
978	0	06	Gollancz
...	...	...	...

Extreme Example

- Observation: we still store the authors' names multiple times
  - DKNF would create author as a single table
  - Note: we need an artificial key

ISBN1	ISBN2	ISBN3	ISBN4	ISBN5	Author_ID
978	0	857	52009	8	1
978	0	857	52009	8	2

ISBN1	ISBN2	ISBN3	ISBN4	ISBN5	Title	Year
978	0	857	52009	8	The Long Earth	2012

Author_ID	Author_First	Author_Last
1	Stephen	Baxter
2	Terry	Pratchett
3	Alastair	Reynolds
…	…	…

ISBN1	ISBN2	ISBN3	Publisher
978	0	857	Doubleday
978	0	857	Harper
978	0	06	Gollancz
…	…	…	…

Extreme Example

- Normalizing broke a relatively small table into four

- Discussion
  - Is it useful to break the ISBN?
  - Which of the three additional tables do we actually need?
 - Notion of atomicity/scalarity can be very subtle

- Visualization of ISBN numbers:
  - https://phiresky.github.io/blog/2025/visualizing-all-books-in-isbn-space/
  - https://phiresky.github.io/isbn-visualization

ER Models vs. Normal Forms

- Note: the relation between authors and books is an n:m relation

- ER models
  - n:m relations are represented by their own table in the database

- Normalization
  - ultimately creates a table for the n:m relation, too

The Normalization Process

- Levels of normalization based on the amount of redundancy in the database

- Various levels of normalization are:
  - First Normal Form (1NF)
  - Second Normal Form (2NF)
  - **Third Normal Form (3NF)**
  - **Boyce-Codd Normal Form (BCNF)**
  - Fourth Normal Form (4NF)
  - Fifth Normal Form (5NF)
  - Domain Key Normal Form (DKNF)

Less Redundancy

Better Consistency

More Tables

Higher Complexity
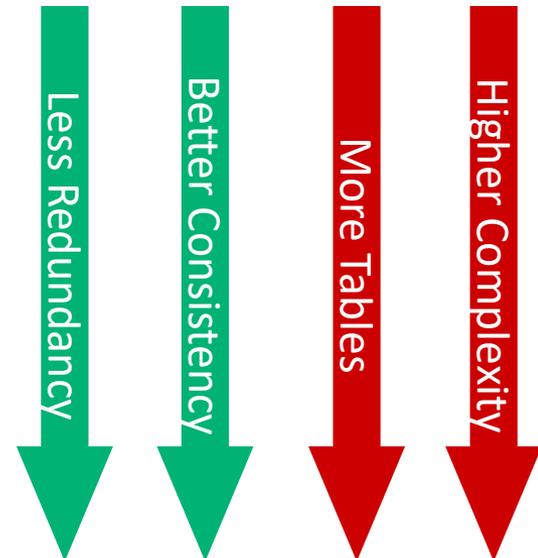

Normal Forms in a Nutshell

- Notions:
  - 1NF: based on atomic/scalar values
  - 2NF, 3NF, BCNF: based on keys and functional dependencies
  - 4NF: based on keys and multi-valued dependencies
  - 5NF: based on join dependencies
  - DKNF: based on domain definitions

- In practice
  - 3NF/BCNF is most used
  - The other NFs are rather of academic interest
    - e.g., 3NF relations that are not 4NF are rather rare

Trade-Offs

- Normalization is a trade-off
- Pro:
  - Avoid inconsistencies
  - Reduce storage
- Con:
  - Increase complexity
  - Decrease performance
- 3NF vs. BCNF
  - Pro: more inconsistencies avoided
  - Con: some dependencies lost

Summary

- How to obtain a *good* database design
  - Avoiding redundancy
  - Avoiding inconsistency

- Normalization
  - Step-by-step modification of your database design
  - Successively refines the design

- Caveat
  - Normalization until the bitter end also has shortcomings…
  - Never lose the use cases out of sight
