

# Semantic Web Technologies Organization

# Hello

- Prof. Dr. Heiko Paulheim
  - Chair for Data Science
- Research Interests:
  - Knowledge Graphs on the Web and their Applications
  - Data Quality and Data Cleaning on Knowledge Graphs
  - Using Knowledge Graphs in Data Mining
  - Societal Impact of Artificial Intelligence
- Room: B6 26, B0.22
- Consultation: Tuesdays 9-10
  - Please make an appointment with Bianca Lermer upfront
- Heiko will teach the lectures

# Hello

- M.Sc. Sven Hertling
- Graduate Research Associate
- Research Interests:
  - Semantic Technologies / Semantic Web
  - Linked Data
  - Knowledge Graphs
- eMail: [sven@informatik.uni-mannheim.de](mailto:sven@informatik.uni-mannheim.de)
- Sven will teach the exercises and co-supervise the projects.

# Introduction and Course Outline

- Administration
- Introduction
  - Vision of the Semantic Web
  - Building blocks of the Semantic Web
  - Technical foundations

# Course Organization

- Lecture
  - Semantic Web standards and languages
  - Programming for the semantic web
  - Creating semantic web data
- Exercise
  - Understand semantic web principles, play with real data
- Project Work
  - teams of 3-4 students build a Semantic Web application
  - teams may choose their own data sets and tasks  
(in addition, we will propose some pointers for ideas)
  - write summary about project, present project results
  - **not graded, but mandatory**
- Final exam
  - **final grades are only based on written exam**

# Course Organization

- Registration
  - you have registered via Portal2
  - you should have access to ILIAS
  - the course is fully booked
    - if you decide not to attend, please write to Ms. Czanderle

# Course Contents and Schedule

- Today: Introduction
- 05.10.: Knowledge Representation with RDF
- 12.10.: Simple ontologies with RDF Schema
- 19.10.: Linked Open Data, Programming the Semantic Web
- 26.10.: SPARQL, Intro to student projects
- 02.11.: Knowledge Graphs
- 09.11.: Complex Ontologies with OWL
- 16.11.: Reasoning with complex ontologies
- 23.11.: Ontology engineering, top level ontologies
- 30.11.: Semantic Web Data Quality and Interlinking
- 07.12.: *Project Presentations*

# Deadlines

- Submission of project work proposal
  - Sunday, November 1<sup>st</sup> 23:59
- Submission of final project work report
  - Wednesday, December 9<sup>th</sup>, 23:59

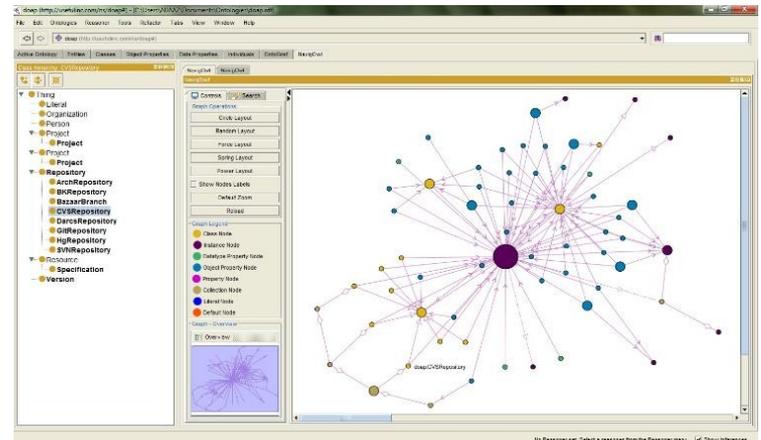

# Course Organization

- Lecture Webpage: Slides, Announcements, Web Links
  - hint: look at version tags of slides!
- Additional Material
  - ILIAS eLearning System, <https://ilias.uni-mannheim.de/>
- Time and Location
  - Lecture: Monday, 13.45 – 15.15, Room WIM-ZOOM-03
  - Exercise: Friday, 12.00 - 13.30, Room WIM-ZOOM-03

# Further Reading and Software

- Follow the links on the website
  - Most material is available online
- Programming environment
  - JENA framework (Java)
  - RDFlib (Python)
- Ontology engineering environment
  - Protégé
  - <http://protege.stanford.edu/>

# Warning

- This lecture contains
  - cartoons
  - Java and Python code
  - some digressions to philosophy
- Having said that:
  - have fun! :-)

# Questions?

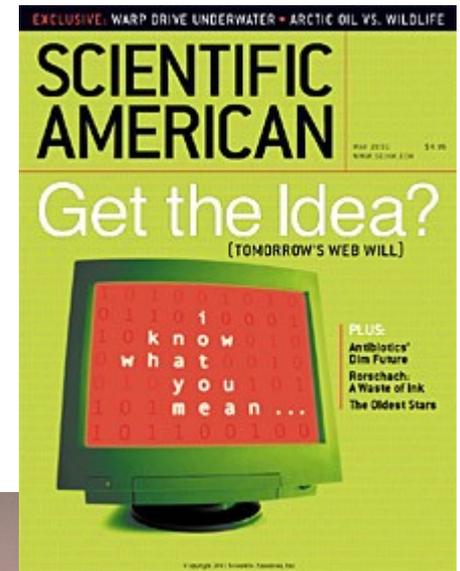

# Semantic Web Technologies Introduction

# What is the Semantic Web?

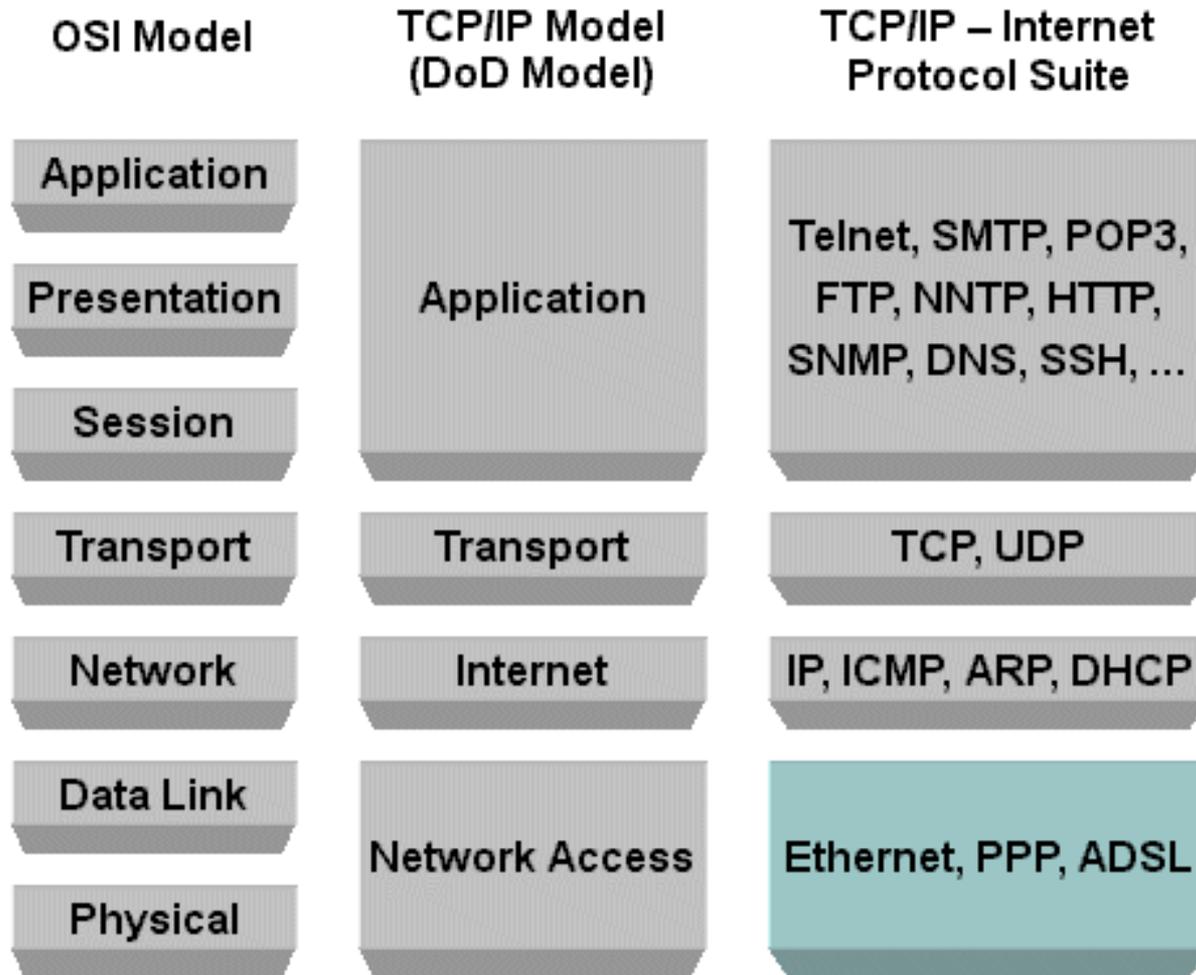

- 2001 article by Tim Berners-Lee, Jim Hendler, and Ora Lassila:

„The Web is the killer app of the Internet.  
The Semantic Web is another killer app  
of that magnitude.“

Berners-Lee et al. (2001): *The Semantic Web*. In: Scientific American, Mai 2001.

# Web vs. Internet?

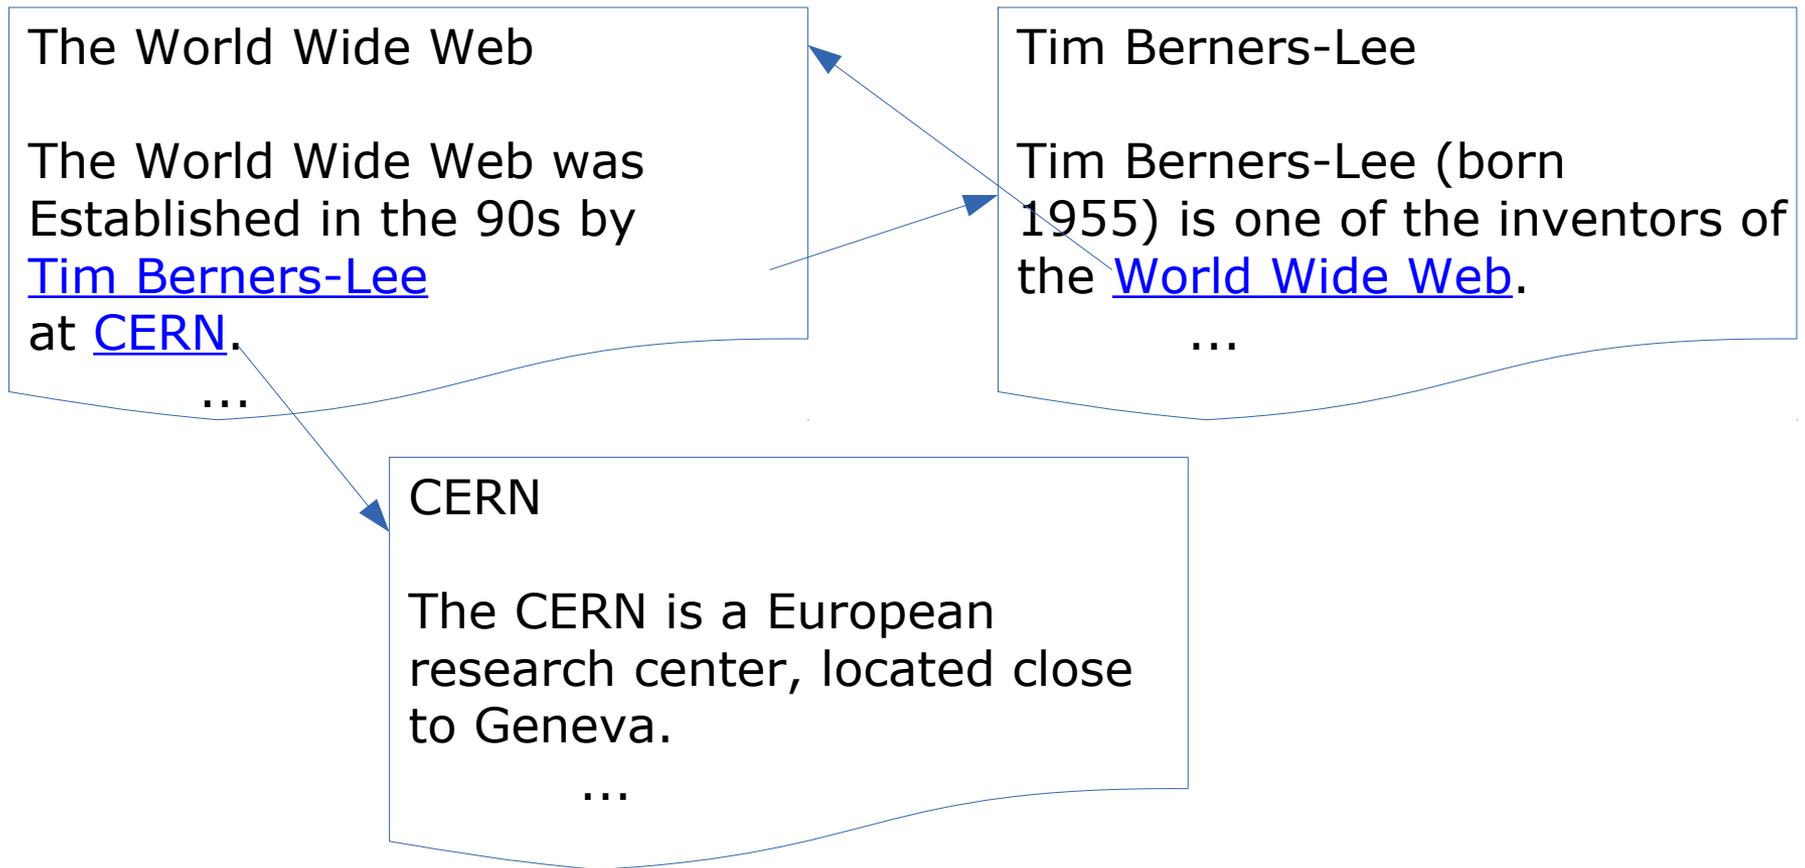

Chin-Shiuh Shieh (2000): *TCP/IP - Internet Protocol Suite and Ethernet*. <http://bit.kuas.edu.tw/~csshie/teach/np/tcpip/index.html>

# The “Classic” Web

- a.k.a. “World Wide Web”, “Document Web”
- Uses HTTP protocol and URLs
- HTML as a markup language
  - plus CSS, JavaScript, ...
  - plus a few other, more or less standardized formats (GIF, JPEG, Flash, ...)
- Browser as a universal client

# The “Classic” Web

- Hypertext: linked documents

# A Short History of the Web

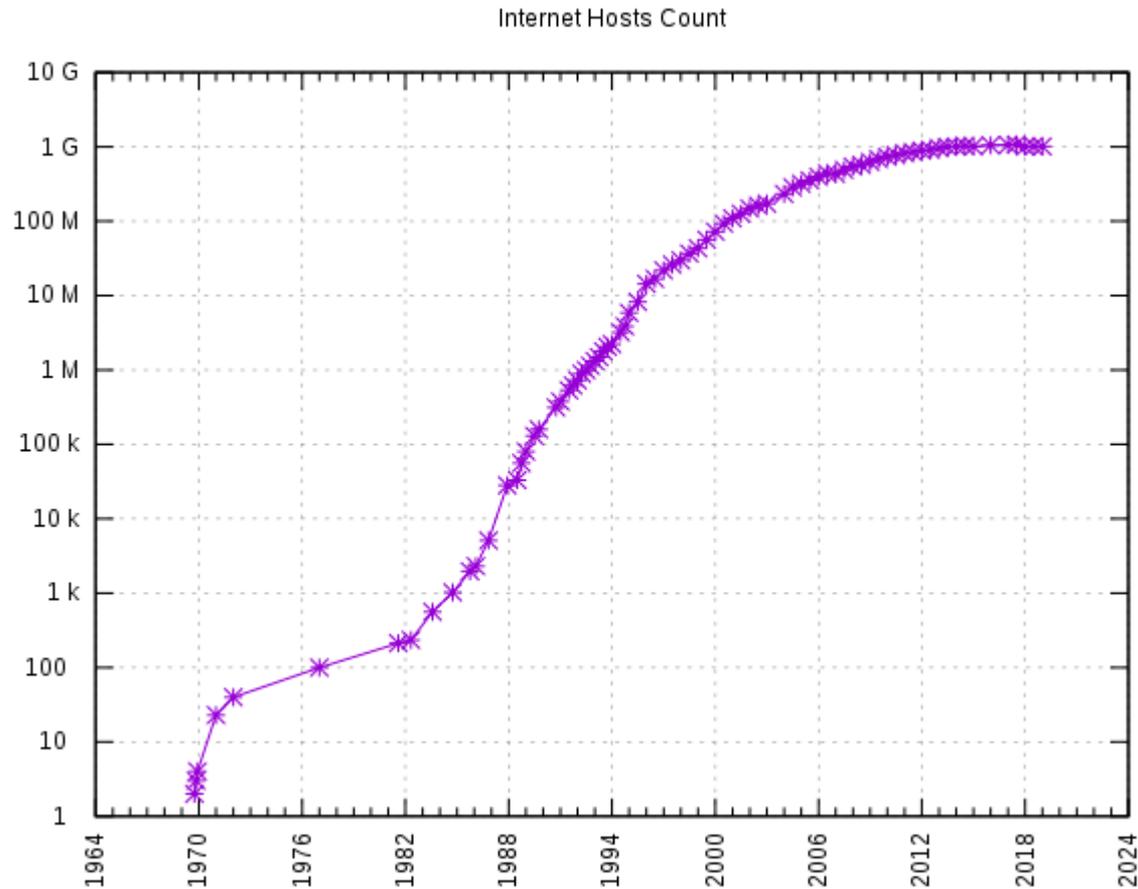

- 1974: TCP/IP Standard
- 1979: First Multi User Game
- 1985: First domain registered  
1,000 computers online
- 1989: Hypertext concept  
by Tim Berners-Lee
- 1991: First HTML version (20 elements)
- 1992: ~1,000,000 computers online
- 1993: Mosaic-Browser,  
around 500 web servers world wide
- 1994: Full text search engines (WebCrawler, Lycos)  
Web catalogues (Yahoo!, AltaVista)  
Foundation of the W3C

# A Short History of the Web

- 1995: Internet Explorer
- 1996: HTTP Standard
- 1998: Foundation of Google
- 2000: Dotcom Bubble, Stock Market Crash, GPRS (mobile Web)
- 2001: Foundation of Wikipedia
- 2003: Foundation of Skype
- 2004: First version of Firefox
- 2006: Foundation of Twitter and WikiLeaks
- 2007: Netflix starts streaming movies
- 2009: First LTE mobile network
- 2011: UN declares disconnection of people from the internet a human rights violation
- 2014: 1,000,000,000 computers online

# Growth of the Web

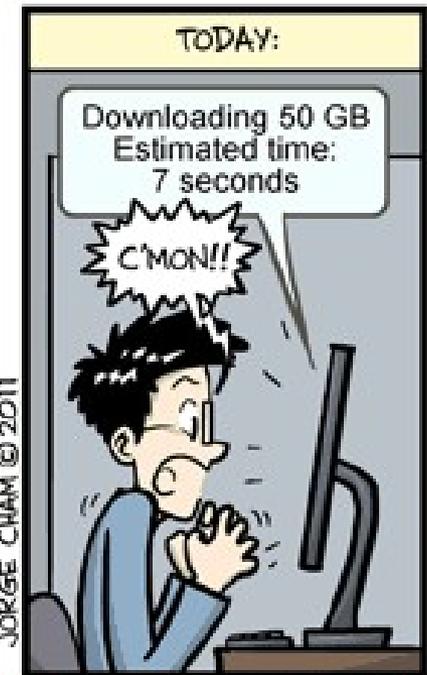

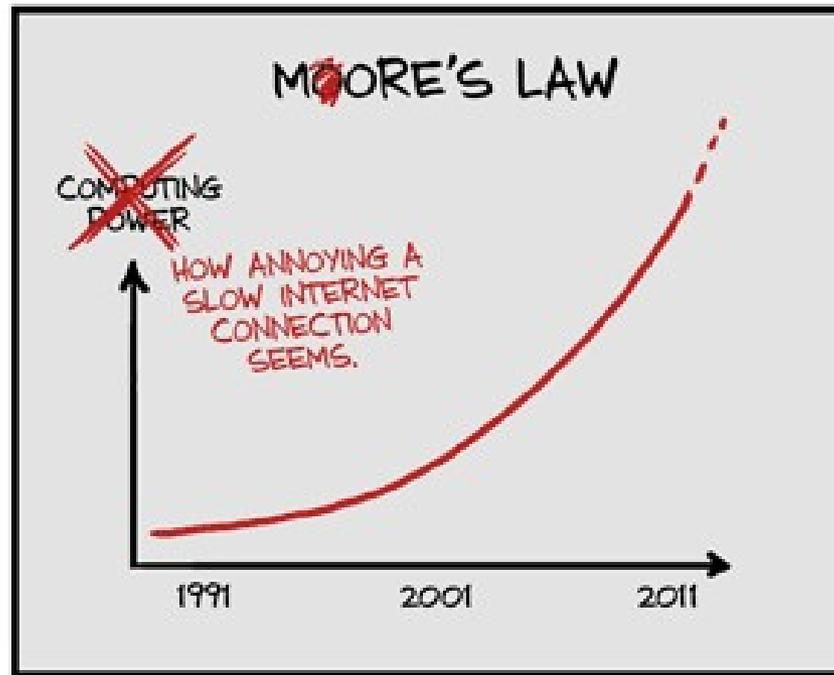

[https://commons.wikimedia.org/wiki/File:Internet\\_Hosts\\_Count\\_log.svg](https://commons.wikimedia.org/wiki/File:Internet_Hosts_Count_log.svg)

# The Dotcom Bubble and Stock Market Crash

[http://de.wikipedia.org/w/index.php?title=Datei:NASDAQ\\_IXIC\\_-\\_dot-com\\_bubble.png&filetimestamp=20050426161953](http://de.wikipedia.org/w/index.php?title=Datei:NASDAQ_IXIC_-_dot-com_bubble.png&filetimestamp=20050426161953)

# Evolution of the Web

# The “Classic” Web

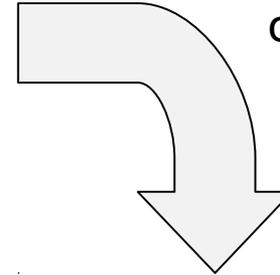

In the eyes of a human

```
<html>
...
<b>Dr. Mark Smith</b>
<i>Physician</i>
Main St. 14
Smalltown
Mon-Fri 9-11 am
Wed 3-6 pm
...
</html>
```

**Dr. Mark Smith**  
*Physician*  
Main St. 14  
Smalltown  
Mon-Fri 9-11 am  
Wed 3-6 pm

in the eyes of a computer

```
Print in bold: „hmf298hmmhuds“
Print in italics: „mj2i9ji0“
Print normal: „fdsah
02hfadsh0um2m0adsmf0ihm
asdfjköfdsa298ndsfmij32mio
lk2mjpoimjiofdpmsajiomjm“
```

# Searching for Information on the Web

Full text search by keywords (e.g., Google):

- „Mark Smith“
- „Physician in Smalltown“
- „Doctor in Smalltown“
- „Doctor in Smalltown with opening hours on Wednesday afternoon“
- „Somebody in Smalltown who can fix a broken leg“

→ “classic” Web is too inflexible for useful search

→ hard to use for intelligent agents

```
<html>
...
  <b>Dr. Mark Smith</b>
  <i>Physician</i>
  Main St. 14
  Smalltown
  Mon-Fri 9-11 am
  Wed 3-6 pm
...
</html>
```

# Problems of the “Classic” Web

- Finding information
  - Keyword based search instead of natural language questions
  - Different natural languages
  - Synonyms, homonyms and polysemous words
  - Ambiguity of natural language
- Processing information
  - Formats and encodings
- Making use of information
  - Distributed across pages
  - e.g., a book's author on the publishers site, address on his/her personal page

<http://geekandpoke.typepad.com/geekandpoke/2011/08/coders-love-unicode.html>

# Homonyms and Polysemous Words

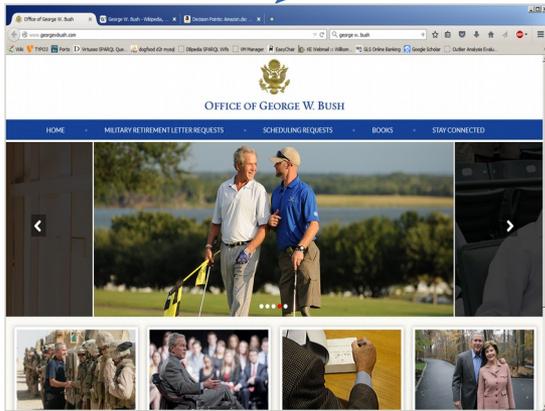

# Untyped Links

[Bush](#) Era Law Could Get You 20 Years in Prison For Clearing Your Browser History

?

?

?

# Example: Wolfram Alpha

The screenshot shows the Wolfram Alpha interface with the search query "distance from mannheim to karlsruhe". The results include assumptions for city interpretations, input interpretation, a primary result of 55.84 km, unit conversions, and a table of direct travel times.

WolframAlpha computational intelligence.

distance from mannheim to karlsruhe

Extended Keyboard Upload Examples

Assuming "mannheim" is a city | Use as an airport instead  
Assuming "karlsruhe" is a city | Use as a ship instead  
Assuming Karlsruhe (Germany) | Use Karlsruhe (United States) instead

Input interpretation:

distance	from	Mannheim, Baden-Wuerttemberg
	to	Karlsruhe, Baden-Wuerttemberg

Open code

Result:

55.84 km (kilometers)

Unit conversions:

34.7 miles

55.84 km (kilometers)

55 840 meters

$5.584 \times 10^6$  cm (centimeters)

30.15 nmi (nautical miles)

Direct travel times: More

car (55 mph)	38 minutes
sound	2 minutes 44 seconds
light in fiber	261 $\mu$ s (microseconds)
light in vacuum	186 $\mu$ s (microseconds)

(straight-line path)

Multiple interpretations of "Mannheim" and "Karlsruhe"

Multiple interpretations of "distance"

# Example: Wolfram Alpha

The screenshot shows a Firefox browser window displaying the Wolfram Alpha website. The address bar contains the URL `http://www.wolframalpha.com/input/?i=what+is+the+most+famous+work+by+goethe`. The page header includes navigation links: HOME, EXAMPLES, PRODUCTS, BLOG, ABOUT, and a note "A WOLFRAM WEB RESOURCE".

The main content area features the Wolfram Alpha logo and a search input field containing the query "what is the most famous work by goethe". Below the input field, there are links for "Examples" and "Random". The result is displayed as "Using closest Wolfram|Alpha interpretation: famous work goethe".

The "Input interpretation" section shows "Goethe" and "occupation" as the interpreted terms. The "Result" section displays "author". Below the result, there are links for "Computed by Wolfram|Mathematica", "Source Information", "Download as: PDF", and "Live Mathematica".

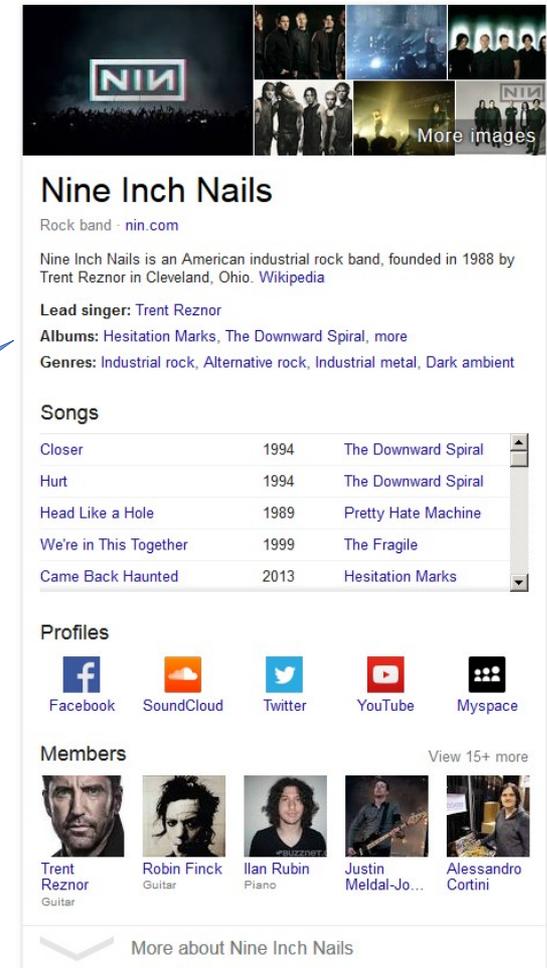

On the right side, there are social media sharing icons (email, Twitter, Facebook, LinkedIn, Print) and a button that says "Ask the Wolfram|Alpha Community for help".

At the bottom, there is a "Give us your feedback" form with a "send" button. The footer contains navigation links: About, Products, Mobile Apps, Business Solutions, For Developers, Resources & Tools, Blog, Forum, Participate, Contact, Connect, and social media icons. Copyright information is provided: © 2011 Wolfram Alpha LLC—A Wolfram Research Company | Terms | Privacy | Entity Index. A note at the bottom states: [Infrastructure for this computation provided by Wolfram|Alpha compute partner Dell, Inc.]

# Example: Google Knowledge Graph

- Paradigm shift in Web Search (2012)
  - “Things, not strings”
- Contains structured data for many entities
- Displayed to the user in a uniform way
- Connect entities via named links

note: these are  
*typed* links!

**Nine Inch Nails**  
Rock band - [nin.com](http://nin.com)

Nine Inch Nails is an American industrial rock band, founded in 1988 by Trent Reznor in Cleveland, Ohio. [Wikipedia](#)

[More about Nine Inch Nails](#)

Feedback

# Example: Enterprise Knowledge Graphs

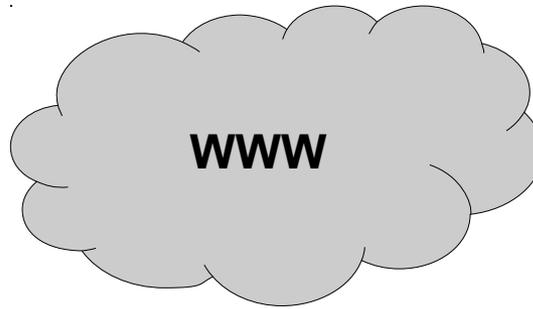

- Many companies use knowledge graphs
  - As a unified access point to their data
  - To allow joint reasoning over different data sources

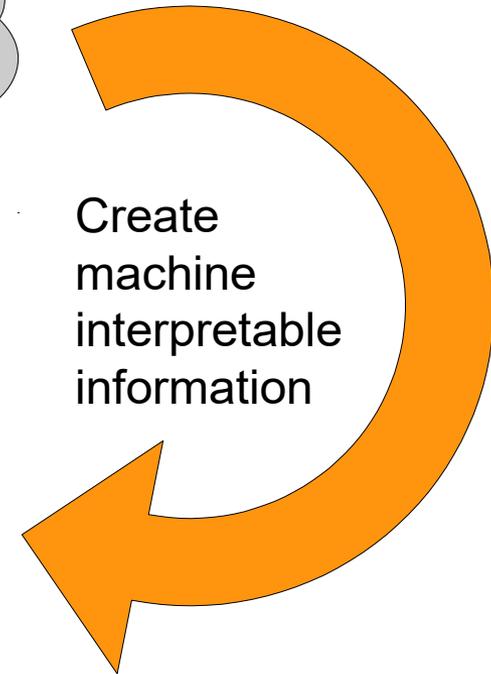

<https://dl.acm.org/citation.cfm?id=3332266>

# Solutions

Lectures:  
Web Mining,  
Information Extraction

Lecture:  
Semantic Web  
Technologies

# The Semantic Web Idea

- Provide information in machine interpretable form
- Make (semantic) links between (data) documents usable
- Allow reasoning
- Facilitate useful (!) complex queries

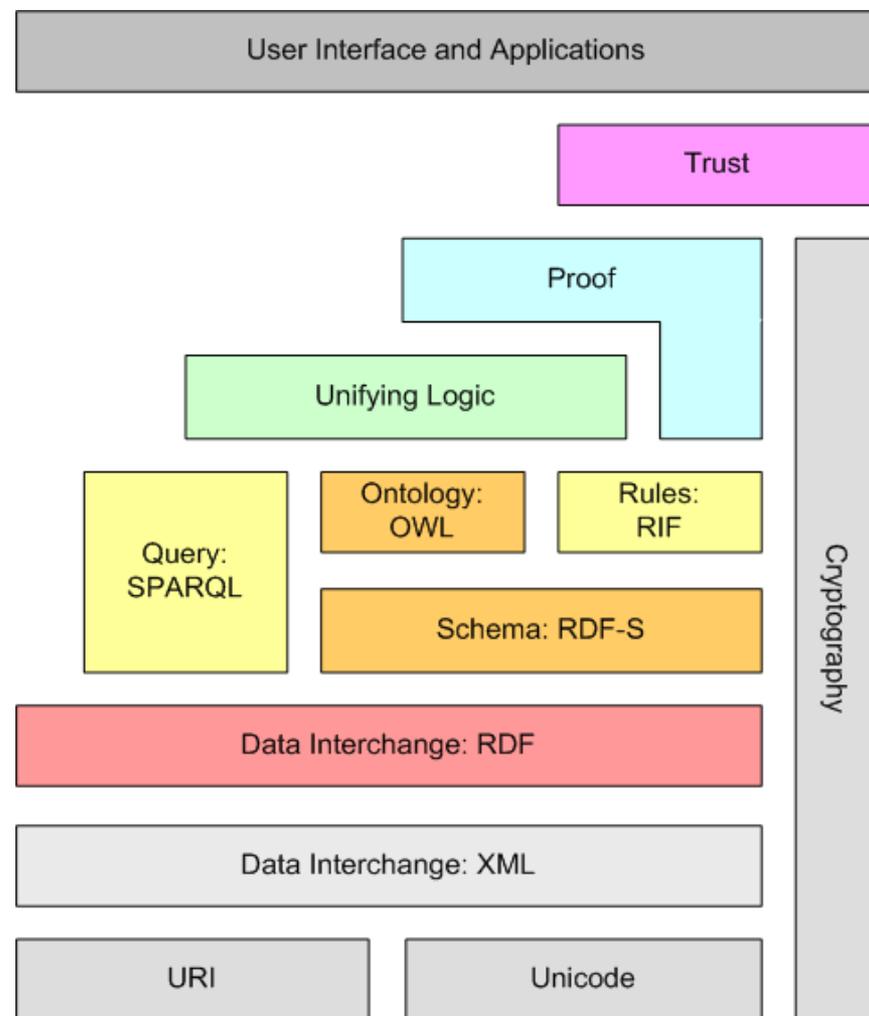

# Semantic Web – Architecture

here be dragons...

Semantic Web Technologies  
(This lecture)

Technical Foundations

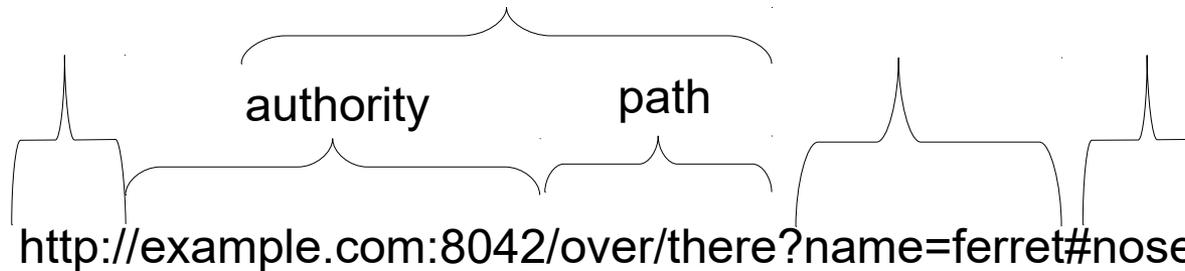

Berners-Lee (2009): *Semantic Web and Linked Data*  
<http://www.w3.org/2009/Talks/0120-campus-party-tbl/>

# Uniform Resource Identifiers (URIs)

- Proposed by Tim-Berners-Lee as „Universal Resource Identifier“ (IETF RFC 1630)
- Standardized: IETF RFC 3986 (2005)
- Used for naming and finding resources on the Web

URI = scheme ":" hier-part [ "?" query ] [ "#" fragment ]

# URIs vs. URLs

- Uniform Resource Locators (IETF RFC 1738, 1994) are a *subset* of URIs
- URIs can refer to *arbitrary* things
- A URL refers to a resource on the Web
- Typical URL prefixes
  - http
  - ftp
  - mailto
  - telnet
  - file
  - ...

# URLs on the Web

- Most common usage:  
Hyperlinks in HTML documents
- Links usually do not carry  
any meta information

Tim Berners-Lee

Tim Berners-Lee (born 1955) is one of the inventors of the [World Wide Web](#).

...

<http://www.w3.org/WWW/>

The World Wide Web

The World Wide Web was initiated in the 90s by [Tim Berners-Lee](#) at [CERN](#).

...

<http://www.w3.org/People/Berners-Lee/>

# Character Sets on the Web

- ASCII („American Standard Code for Information Interchange“) ISO 646 (1963), 127 characters, 95 of which are printable:

!"#\$%&'()\*+,-./0123456789:;<=>?

@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^\_

`abcdefghijklmnopqrstuvwxyz{|}~

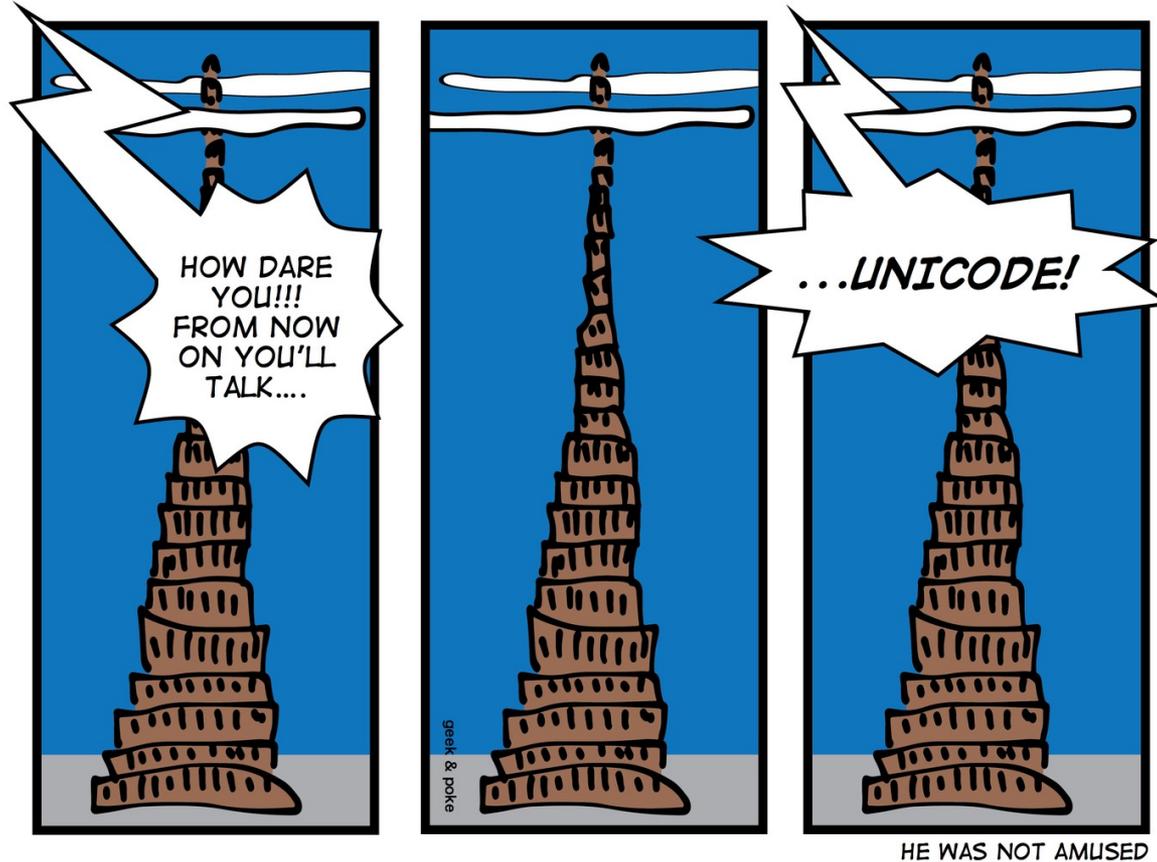

- Extension to 8 Bit: ISO 8859-1 to -16 (1998)
  - covers major European languages
  - most well known: 8859-1 („Latin-1“)
- The Web, however, speaks many more languages...

وللحبّ علامات يقفوها الف  
فأولها إدمان النظر، والعي  
سرايرها، والمعبرة لضمائرها  
بر لا يطرف، يتنقل بتنقل  
ن مال، كالحرباء مع الشمس

国中爱我

# The Multilingual Web

## TOWER OF BABEL

<http://geek-and-poke.com/geekandpoke/2013/8/29/when-it-all-began>

# Unicode

- ISO 10646
  - first version 1991 (Europe, Near East, India)
  - Unicode 13.0 (March 2020)
  - defines ~144,000 characters
  - covers even very exotic languages
  - Plus: currency symbols, emojis, sign language, ...

Klingon  
is still  
missing!!!

# Information Representation in XML

XML (eXtensible Markup Language)

- A W3C standard since 1998
- Universal format for data exchange

```
<physician>
  <name>Dr. Mark Smith</name>
  <address>
    <street>Main St.</street>
    <number>14</number>
    <city>Smalltown</city>
  </address>
  <telephone>
    <number>+44 123 456789</number>
  </telephone>
  <hours>
    <monday>9-11 am</monday>
    <tuesday>9-11 am</tuesday>
    ...
  </hours>
</physician>
```

# XML: Basic Concepts

- Tags (arbitrarily definable):
  - Form pairs:  
`<physician> ... </physician>`
  - ...or empty element tags  
`<young />`
- Attributes:  
`<physician location="Smalltown">`
- Tags are nested (with *exactly one* root element):  
`<physician>  
 <address> ... </address>  
</physician>`

# XML: Well-formed Documents

```
<physician>
  <name>Dr. Mark Smith</name>
  <address>
    <street>Main St.</street>
    <number>14</number>
    <city>Smalltown</city>
  </address>
  <telephone>
    <number>+44 123 456789</number>
  </telephone>
  <hours>
    <monday>9-11 am</monday>
    <tuesday>9-11 am</tuesday>
    ...
  </hours>
</physician>
```

```
<physician>
  <name>Dr. Mark Smith</name>
  <address>
    <street>Main St.</street>
    <number>14</number>
    <city>Smalltown</city>
  <telephone>
    <number>+44 123 456789</number>
  </address>
  </telephone>
  <hours>
    <monday>9-11 am</monday>
    <tuesday>9-11 am</tuesday>
    ...
  </hours>
</physician>
```

# HTML and XML

- HTML documents look like XML documents
  - ...but they are usually not well-formed!

```
<p>Look at this!<img src=smiley.gif> <br>
```

- XHTML: HTML as well-formed XML documents
- A W3C standard since 2000

```
<p>Look at this! <br/> </p>
```

# XPath: Accessing Information in XML

- Query language for XML
- A W3C standard since 1999 (Version 2.0: 2010)

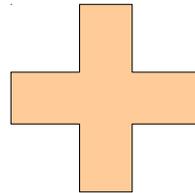

```
/physician[name='Dr. Mark Smith']/telephone/number
```

```
<physician>
  <name>Dr. Mark Smith</name>
  <address>
    <street>Main St.</street>
    <number>14</number>
    <city>Smalltown</city>
  </address>
  <telephone>
    <number>+44 123 456789</number>
  </telephone>
  <hours>
    <monday>9-11 am</monday>
    <tuesday>9-11 am</tuesday>
    ...
  </hours>
</physician>
```

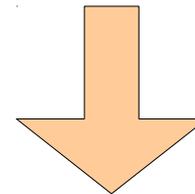

# XSLT: Transformation of XML Documents

- Stylesheet based processing of XML documents
- A W3C standard since 1999
- Uses XPath

```
<physician>
  <name>Dr. Mark Smith</name>
  <address>
    <street>Main St.</street>
    <number>14</number>
    <city>Smalltown</city>
  </address>
  <telephone>
    <number>+44 123 456789</number>
  </telephone>
  <hours>
    <monday>9-11 am</monday>
    <tuesday>9-11 am</tuesday>
    ...
  </hours>
</physician>
```

```
<xsl:template match="/pyhsician">
  <b>
    <xsl:value-of select="name"/>
  </b>
</xsl:template/>
```

```
<b>Dr. Mark Smith</b>
```

# Namespaces in XML

- Elements with the same name can occur in different places
  - ...but the contents and semantics may differ
- How can we tell them apart?

```
<physician>
  <name>Dr. Mark Smith</name>
  <address>
    <street>Main St.</street>
    <number>14</number>
    <city>Smalltown</city>
  </address>
  <telephone>
    <number>+44 123 456789</number>
  </telephone>
  <hours>
    <monday>9-11 am</monday>
    <tuesday>9-11 am</tuesday>
    ...
  </hours>
</physician>
```

# Namespaces in XML

- Namespace definition using prefixes (Notation: `prefix:name`)
- Each namespace itself is a URI
- Default namespaces may be defined

```
<physician xmlns      ="http://www.med.com/physician"
           xmlns:addr="http://www.med.com/addr">
  <name>Dr. Mark Smith</name>
  <addr:address>
    <addr:street>Main St.</addr:street>
    <addr:number>14</addr:number>
    <addr:city>Smalltown</addr:city>
  </addr:address>
  <telephone>
    <number>+44 123 456789</number>
  </telephone>
  <hours>
    <monday>9-11 am</monday>
    <tuesday>9-11 am</tuesday>
    ...
  </hours>
</physician>
```

# XML: Document Type Definition (DTD)

- Defines valid elements for a class of XML documents
  - Names
  - allowed attributes
  - allowed nested child elements
- DTD is a part of the W3C's XML specification
- XML documents matching a DTD are called “valid”

# XML: Document Type Definition (DTD)

```
<!DOCTYPE physician [  
<!ELEMENT physician (  
  name,  
  address*,  
  telephone?,  
  fax?,  
  hours)>  
  
<!ELEMENT address (  
  street,  
  number,  
  city)>  
  
<!ELEMENT street (#PCDATA)>  
  
  ...  
>
```

```
<!DOCTYPE physician SYSTEM  
  "physician.dtd">  
  
<physician>  
  <name>Dr. Mark Smith</name>  
  <address>  
    <street>Main St.</street>  
    <number>14</number>  
    <city>Smalltown</city>  
  </address>  
  <telephone>  
    <number>+44 123 456789</number>  
  </telephone>  
  <hours>  
    <monday>9-11 am</monday>  
    <tuesday>9-11 am</tuesday>  
    ...  
  </hours>  
</physician>
```

# XML: Document Type Definition (DTD)

- Definition of child elements and their order

```
<!ELEMENT address (street, no, line*, zip, city, state?)>
```

- ?, + and \* mark optional and possible multiple elements

- Definition of attribute lists

```
<!ATTLIST person title CDATA>
```

- Allowed modifiers: #REQUIRED, #FIXED, #IMPLIED, “...”
- Enumerating allowed values: (dr|prof)

- Definition of entities:

```
<!ENTITY sw "Semantic Web">
```

- May be used as shortcuts in the XML document: &sw;

# XML Schema

- W3C-Standard (since 2004)
- XML schemas are XML files themselves
- More flexible than DTDs:
  - Minimum and maximum number of elements
  - Combinations of elements (either/or, combinations w/out fixed order, ...)
  - Data types (Numbers, dates, ...), own types may be defined
  - Support for namespaces
  - Possibility to create modular schemas

# XML Schema

```
<xs:schema elementFormDefault="qualified"
  xmlns:xs="http://www.w3.org/2001/XMLSchema">
```

```
  <xs:element name="physician">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="name"
          type="xs:string">
        <xs:element name="address">
          <xs:complexType>
            <xs:sequence>
              <xs:element name="street"
                type="xs:string">
              ...
            </xs:sequence>
          </xs:complexType>
        </xs:element>
        ...
      </xs:sequence>
    </xs:complexType>
  </xs:element>
</xs:schema>
```

```
<physician xmlns:xsi=

# XML Schema – Modular Schemas

```
<xs:schema elementFormDefault="qualified"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:addr="http://www.address.com/">

  <xs:import
    namespace="http://www.address.com/"
    schemaLocation="address.xsd"/>
  <xs:element name="physician">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="name"
          type="xs:string">
          <xs:element ref="addr:address" />
          ...
        </xs:sequence>
      </xs:complexType>
    </xs:element>
  </xs:schema>
```

```
<xs:schema elementFormDefault="qualified"
  xmlns:xs="http://www.w3.org/2001/XMLSchema">

  <xs:element name="address">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="street"
          type="xs:string">
          ...
        </xs:sequence>
      </xs:complexType>
    </xs:element>
  </xs:schema>
```

# Example: Modular Schemas in XHTML

```
<html xmlns:  
  xmlns:  
<body>  
  <h1>SVG  
  <svg:sv  
    <svg:  
      fill:  
    </svg:s  
  </body>  
</html>
```

## SVG embedded inline in XHTML:

[https://developer.mozilla.org/En/SVG:Namespaces\\_Crash\\_Course](https://developer.mozilla.org/En/SVG:Namespaces_Crash_Course)

# So, what does a DTD/Schema Define?

- Syntax – σύνταξις („together“ + „order“)
  - Which elements are there?
  - How are they arranged?
  - Which combinations are allowed?
- ...as opposed to: Semantics - σημαίνει („denote“)
  - How to interpret the contents of an element?
  - What is their relation?

# Syntax and Semantics: The Linguists' View

- Syntax: how are correct sentences formed?
  - „This sentence no verb.“
  - „The dreaming lamp **give** gives a freshly cut **juices** juice to the **tire** tired sink.
- Semantics: what does a word and sentence *mean*?
- Notes
  - syntactic correctness does not guarantee semantic interpretability
  - semantic interpretability does not require syntactic correctness (for humans)

# Syntax and Semantics: The Linguists' View

syntax

Definition of **knowledge** noun from the Oxford Advanced Learner's Dictionary

**knowledge** noun

BrE /'nɒlɪdʒ/; NAmE /'nɑ:lɪdʒ/

★ Add to my wordlist

1 [uncountable, singular] the information, understanding and skills that you gain through education or experience

- *practical/medical/scientific knowledge*
- **knowledge of/about something** *He has a wide knowledge of painting and music.*
- *There is a lack of knowledge about the tax system.*

→ SEE RELATED ENTRIES: **Teaching and learning**

2 [uncountable] the state of knowing about a particular fact or situation

- *She sent the letter **without my knowledge**.*
- *The film was made with the Prince's **full knowledge** and approval.*
- *She was impatient **in the knowledge** that time was limited.*
- *I went to sleep **secure in the knowledge** that I was not alone in the house.*
- *They could relax **safe in the knowledge** that they had the funding for the project.*
- *He **denied all knowledge** of the affair.*

3 **knowledge economy/industry/worker** working with information rather than producing goods

- *the emergence of consultancy as a knowledge industry*
- *the shift toward a knowledge economy*

semantics

# So, what does a DTD/Schema Define?

## Employee catalog of the hospital

```
<physician>
  <name>Dr. Mark Smith</name>
  <address>
    <street>Main St.</street>
    <number>14</number>
    <city>Smalltown</city>
  </address>
  <telephone>
    <number>+44 123 456789</number>
  </telephone>
  <hours>
    <monday>9-11 am</monday>
    <tuesday>9-11 am</tuesday>
    ...
  </hours>
</physician>
```

(probably)  
the private address

## Yellow Pages

```
<physician>
  <name>Dr. Mark Smith</name>
  <address>
    <street>Main St.</street>
    <number>14</number>
    <city>Smalltown</city>
  </address>
  <telephone>
    <number>+44 123 456789</number>
  </telephone>
  <hours>
    <monday>9-11 am</monday>
    <tuesday>9-11 am</tuesday>
    ...
  </hours>
</physician>
```

(probably)  
the work address

# So, what does a DTD/Schema Define?

- XML Schema / DTD defines the *syntax* of an XML document, but not its *semantics*
- Tag names are not interpretable by machines
  - i.e., they do not ease the information retrieval process...
  - Semantics of the data is hidden – usually hard wired in the application
- The Semantic Web is meant as a remedy to that problem
  - *Semantic Web is/can do more than XML!*

```

    <fj9>9-11 am</fj9>
    ...
  </vsfif>
</2nf3oiü*>
```

# A Note on Web Services

- Original vision
  - Describe functions of services as XML
  - e.g., stock market ticker, calculator, travel booking...
- ...so that an intelligent agent can combine them
  - and dynamically create a system for a given purpose
- Standards
  - WSDL, UDDI, SOAP, ...
- Problem
  - The semantics is missing!

# Wrap Up

- Problems of the classic web
  - Not usable for machines / intelligent agents
- URIs
  - Unique identifiers for resource
  - URLs are dereferencable on the Web
- Unicode
  - A character set for all languages
- XML
  - XPath
  - XSLT
  - DTD
  - XML Schema
