

Web Mining

Introduction and Course Organization

Prof. Dr. Christian Bizer
Prof. Dr. Simone Ponzetto
Ralph Peeters
Sotaro Takeshita

FSS 2025

- **Prof. Dr. Christian Bizer**
- **Professor for Information Systems V**
- **Research Interests:**
 - Web-based Systems
 - Large-Scale Data Integration
 - Data and Web Mining
- **Room: B6, 26 - B1.15**
- **eMail: christian.bizer@uni-mannheim.de**
- **Consultation: appointment via email**

- **will teach the lectures on Web Usage Mining and Web Structure Mining**

- **Prof. Dr. Simone Ponzetto**
 - **Professor for Information Systems III**
 - **Research Interests:**
 - Natural Language Processing
 - Computational Social Science
 - **Room: B6 26, B 1.14**
 - **Consultation: Tuesday 13:30-14:30**
 - **eMail: ponzetto@uni-mannheim.de**
 - **Consultation: appointment via email**
-
- **will teach the lectures on Web Content Mining**

Hello

- **M.Sc. Wi-Inf Ralph Peeters**
- **Graduate Research Associate**
- **Research Interests**
 - Entity Matching using Deep Learning
 - Semantic Annotations on the Web
 - Data Integration
- **Office: B6, 26 - C 1.04**
- **eMail: ralph.peeters@uni-mannheim.de**
- **will teach the labs and will coach the student projects (IE684).**

- **M.Sc. Wi-Inf Sotaro Takeshita**
 - **Graduate Research Associate**
 - **Research Interests**
 - Natural Language Processing
 - **Office: B6, 26 - C 1.06**
 - **eMail: sotaro.takeshita@uni-mannheim.de**
-
- **will teach the labs and will coach the student projects (IE684).**

Introduction and Course Organization

1. Course Organization

2. The World Wide Web

1. The Classic Document Web
2. The Web of Data
3. Web 2.0 Applications

3. What is Web Mining?

1. Web Usage Mining
2. Web Structure Mining
3. Web Content Mining
4. The Web Mining Process

1. Course Organization

■ Lecture (IE 671, 3 ECTS)

- covers different types of Web Mining methods
- presents examples of Web Mining applications
- discusses how to evaluate the output of the methods

■ Labs

- students experiment with the methods using different Python libraries

■ Evaluation

- 60 min written exam on 13. June + registration via Portal2 until 16. April

■ Student Projects (IE 684, 3 ECTS, 50 places)

- teams of five students realize a Web Mining project
- teams may choose their own tasks and data sets
(in addition, we will propose some suitable data sets and tasks)
- write a summary about the project, present the project results

■ Evaluation

- report + presentation + code + individual registration via Portal2 until 16. April

Course Organization

■ Website

- organizational information
- lecture slides + exercise material

■ Two ILIAS Groups

- IE 671 Web Mining [V]
- IE 684: Web Mining Project [PRO]

both used as forum and mailing list.

■ Time and Location

- Lecture: Tuesday, 10:15 to 11:45, B6 A101
- Labs: Thursday, 13:45 to 15:15, B6, A203

Schedule

Week	Lecture: Tuesday 10:15	Labs: Thursday 13:45
11.02.2025	Introduction and Course Outline	-
18.02.2025	Web Usage Mining (Bizer)	Web Usage Mining
25.02.2025	Web Usage Mining (Bizer)	Web Usage Mining
04.03.2025	Web Structure Mining (Bizer)	Web Structure Mining
11.03.2025	Web Structure Mining (Bizer)	Web Structure Mining
18.03.2025	Web Content Mining (Ponzetto)	Web Content Mining
25.03.2025	Web Content Mining (Ponzetto)	Web Content Mining
01.04.2025	Introduction to the Student Projects	Preparation of project outlines
08.04.2025	Feedback on the projects outline	Project work
	- Easter break -	
29.04.2025	Project work	Coaching
06.05.2025	Project work	Coaching
13.05.2025	Project work	Coaching
20.05.2025	Project work	Coaching
20.05.2025	Project presentations	-
13.06.2025	Web Mining Exam	

Literature

1. Bing Liu: Web Data Mining. 2nd Edition, Springer.
2. Dietmar Jannach, et al.: Recommender Systems: An Introduction. Cambridge University Press.
3. Wouter de Nooy et al.: Exploratory Social Network Analysis with Pajek. Cambridge University Press.
4. Bing Liu: Sentiment Analysis and Opinion Mining. Morgan & Claypool.

Software Libraries

- Within the Labs, we use the following libraries

A Python scikit for recommender systems.

Home
Documentation
GitHub page

★ Star 🍴 Fork

Maintained by Nicolas Hug
Page built with Jekyll and Hyde

scikit-learn

Machine Learning in Python

- Simple and efficient tools for data mining and data analysis
- Accessible to everybody, and reusable in various contexts
- Built on NumPy, SciPy, and matplotlib
- Open source, commercially usable - BSD license

- We assume some fluency in Python and Jupyter ...

Questions?

2. The World Wide Web

The Web is a global decentralized information space build on a set of technical standards for the identification, retrieval and representation of content.

- **Uniform Resource Identifiers (URIs):** Globally unique identification of Web resources.
- **Hypertext Transfer Protokoll (HTTP):** Protocol for interacting with Web resources.
- **Content Formats:** HTML, XML, RDF, ...
- **The Web was invented in 1989 at CERN by Tim Berners-Lee**
- **Architectural Principles of the Web**

Architecture of the World Wide Web, Volume One,
W3C Specification, 2004, <http://www.w3.org/TR/webarch/>

Topology of the Web Today

2.1 The Classic Document Web

Global information space consisting of **interlinked resources** (HTML pages, images, multimedia).

The Size of the Web

- **overall size: 1 trillion pages on the Web at once**
 - announced by Google in 2008
 - <http://googleblog.blogspot.de/2008/07/we-knew-web-was-big.html>
- **Indexed Web: approx. 50 billion pages**
 - estimate based on search engine hit counts for popular words
 - Example: The word „the“ appears in 67% of all English pages and has 25.2 billion hits on Google
 - <http://www.worldwidewebsize.com/>

Public Web Corpora

- **The non-profit Common Crawl project regularly crawls the Web and publishes large Web corpora**
 - size: 2.5 to 3.5 billion pages
 - pay-level-domains: 30 – 35 million
 - release cycle: 1 month
- **Public download from Amazon S3**
 - size: around 80 Terrabytes compressed
- **Public alternative to private corpora owned by Google and Microsoft**
- **Disadvantages:**
 - one order of magnitude smaller than private crawls
 - monthly releases compared to permanent updates

Sebastian Nagel

Link Structure of the Web: In-Degree

■ The link distribution follows (kind of) a power law

- A small number of pages is target of many links
- A large number of pages is target of only a few or no links

■ Classic Paper:

- Broder et al.:
Graph Structure
in the Web. WWW2000
- AltaVista crawl with over
200 million pages and
1.5 billion links
- Conclusion: Log-log scale
plot shows power-law

In-Degree Distribution

Broder et al. (2000)

Power law with exponent **2.1**

(200 million pages and 1.5 billion links from Altavista crawl 2000)

WDC Hyperlink Graph (2012)

Best power law exponent **2.24**

(3 billion pages and 128 billion links from Common Crawl 2012)

Link Structure of the Web: Bow-Tie

Four mayor components (Border at al., WWW2000)

■ Central Strongly Connected Component (SCC)

- pages that can reach one another along directed links
- about 30% of the Web (normal pages)

■ IN Group

- can reach SCC but cannot be reached from it
- about 20% (maybe new pages or boring ones)

■ OUT Group

- can be reached from SCC but cannot reach it
- about 20% (maybe company pages that don't link)

■ Tendrils

- cannot reach SCC and cannot be reached by it
- about 20%

■ Unconnected

- about 10%

**Probability of path
between nodes is 24%**

Web Graph with Strongly Connected Components

A strongly connected component (SCC) in a directed graph is a subset of the nodes such that:

1. every node in the subset has a path to every other node
2. the subset is not part of some larger set with the property that every node can reach every other.

Size of Central Strongly Connected Component

Largest SCC

■ Broder, 2000:

27.7%

■ WDC, 2012:

51.3 %

➔ Factor 1.8 larger

➔ Also, factor 4.9 more links/page

➔ The Web has become denser

2.2. The Web of Data

More and more Websites

- semantically **markup the content** of their HTML pages
- **publish structured data** in addition to HTML

Markup Formats:

Microdata

RDFa

Structured Data Formats:

JSON-LD

Linked Data

Data is crawl-able using generic crawlers in contrast to Web APIs

Microdata

- format for annotating structured data within webpages
- proposed in 2009 by WHATWG as part of HTML5 work

```
<div itemtype="http://schema.org/Hotel">
  <span itemprop="name">Vienna Marriott Hotel</span>
  <span itemprop="address" itemscope="" itemtype="http://schema.org/PostalAddress">
    <span itemprop="streetAddress">Parkring 12a</span>
    <span itemprop="addressLocality">Vienna</span>
  </span>
  <div itemprop="aggregateRating" itemscope itemtype="http://schema.org/AggregateRating">
    <span itemprop="ratingValue"> 4 </span> stars-based on
    <span itemprop="reviewCount"> 250 </span> reviews.
  </div>
```

- used for embedding data into the HEAD of HTML pages
- putting data in HEAD is recommended by Google as it is empirically less error prone than annotations in BODY

```
<script type="application/ld+json">
{  "@context": "http://schema.org",
   "@type": "Product",
   "description": "Has six preset cooking ....",
   "name": "Kenmore White 17\" Microwave",
   "offers": {
     "@type": "Offer",
     "availability": "http://schema.org/InStock",
     "price": "55.00",
     "priceCurrency": "USD"
   },
}
</script>
```

Google™

bing

YAHOO!

Yandex

- ask site owners since 2011 to annotate data for enriching search results
- 675 Types: Event, Local Business, Product, Review, Job Offer
- Encoding: Microdata, RDFa, JSON-LD

schema.org**Search**

[Home](#) [Schemas](#) [Documentation](#)

Thing > Organization > LocalBusiness

A particular physical business or branch of an organization. Examples of LocalBusiness include a restaurant, a particular branch of a restaurant chain, a branch of a bank, a medical practice, a club, a bowling alley, etc.

Property	Expected Type	Description
Properties from <u>Thing</u>		
description	Text	A short description of the item.
image	URL	URL of an image of the item.
name	Text	The name of the item.
url	URL	URL of the item.
Properties from <u>Place</u>		
address	<u>PostalAddress</u>	Physical address of the item.
aggregateRating	<u>AggregateRating</u>	The overall rating, based on a collection of reviews or ratings, of the item.
containedIn	<u>Place</u>	The basic containment relation between places.

Usage of Schema.org Data @ Google

Gramercy Tavern - Flatiron - New York, NY | Yelp
www.yelp.com › Restaurants › American (New) ▾
★★★★★ Rating: 4.5 - 1,288 reviews - Price range: \$\$\$\$
Jeff C and I were in New York for vacation, and I wanted to treat him to a nice dinner for Gramercy Tavern is certainly a legendary NY dining establishment.

Gramercy Tavern Restaurant - New York, NY | OpenTable
www.opentable.com › ... › Gramercy restaurants ▾
★★★★★ Rating: 4.7 - 508 reviews - Price range: \$50 and over
Book now at Gramercy Tavern in New York, explore menu, see photos and read 508 reviews: "The menu was so limited but it was worth trying, food was deli..."

The Web Data Commons Project

- extracts all Microformat, Microdata, RDFa, JSON-LD data from the **Common Crawl**
- analyzes and provides the extracted data for download
- statistics about some extraction runs
 - 2024 CC Corpus: **2.3 billion HTML pages** → **73.6 billion RDF triples**
 - 2019 CC Corpus: 2.4 billion HTML pages → 44.2 billion RDF triples
 - 2014 CC Corpus: 2.0 billion HTML pages → 20.4 billion RDF triples
 - 2010 CC Corpus: 2.8 billion HTML pages → 5.1 billion RDF triples
- uses **100 machines on Amazon EC2**
 - approx. 3500 machine/hours → 600 Euro
- <http://webdatacommons.org/structureddata/>

Overall Adoption 2024

1.3 billion HTML pages out of the 2.4 billion pages provide semantic annotations **(51.2%)**.

16 million pay-level-domains (PLDs) out of the 37 million pay-level-domains covered by the crawl provide semantic annotations **(44.1%)**.

Frequently used Schema.org Classes

Class	# Websites (PLDs)	
	Microdata	JSON-LD
schema:WebPage	1,124,583	121,393
schema:Product	812,205	40,169
schema:Offer	676,899	57,756
schema:BreadcrumbList	621,344	205,971
schema:Article	612,361	57,082
schema:Organization	510,069	1,349,775
schema:PostalAddress	502,615	176,500
schema:ImageObject	360,875	111,946
schema:Blog	337,843	12,174
schema:Person	324,349	335,784
schema:LocalBusiness	294,390	249,017
schema:AggregateRating	258,078	23,105
schema:Review	124,022	6,622
schema:Place	92,127	66,396
schema:Event	88,130	63,605

Adoption by Travel Websites

Top 15 Travel Websites	schema:Hotel
Booking.com	Yes
TripAdvisor	Yes
Expedia	Yes
Agoda	Yes
Hotels.com	Yes
Kayak	Yes
Priceline	Yes
Travelocity	Yes
Orbitz	Yes
ChoiceHotels	Yes
HolidayCheck	Yes
ChoiceHotels	Yes
InterContinental Hotels Group	Yes
Marriott International	Yes
Global Hyatt Corp.	No

Adoption:
93 %

Hands-on: How to get the Data?

- N-Quads: <http://www.webdatacommons.org/structureddata/>
- JSON: <http://webdatacommons.org/structureddata/schemaorgtables/>

Class-Specific Subsets of the Schema.org Data

Class Name	Total Number of	Top Classes (Entity Count)	Total File Size	Quad File
http://schema.org/AdministrativeArea	Quads: 1,724,857 URLs: 85,625 Hosts: 63	http://schema.org/AdministrativeArea (100,671) http://schema.org/GeoCoordinates (84,152) http://schema.org/Country (83,851) http://schema.org/Continent (83,567)	23 MB	schemaorgAdministrativeArea.nq.gz (sample)
http://schema.org/Hotel	Quads: 148,211,253 URLs: 3,136,152 Hosts: 5,337	http://schema.org/Rating (7,007,590) http://schema.org/Hotel (6,335,124) http://schema.org/Review (4,408,551) http://schema.org/AggregateRating (3,936,372)	2,994 MB	schemaorgHotel.nq.gz (sample)
http://schema.org/JobPosting	Quads: 234,475,135 URLs: 2,011,332 Hosts: 3,962	http://schema.org/JobPosting (22,804,279) http://schema.org/Place (16,321,339) http://schema.org/Organization (12,164,867) http://schema.org/Postaladdress (7,516,387)	5,078 MB	schemaorgJobPosting.nq.gz (sample)
http://schema.org/PostalAddress	Quads: 776,573,609 URLs: 13,475,055 Hosts: 131,064	http://schema.org/PostalAddress (48,086,763) http://schema.org/LocalBusiness (16,641,260) http://schema.org/GeoCoordinates (12,345,942) http://schema.org/Place (9,071,774)	14,364 MB	schemaorgPostalAddress.nq.gz (sample)
http://schema.org/Product	Quads: 2,829,523,589 URLs: 48,314,143 Hosts: 104,118	http://schema.org/Product (287,815,069) http://schema.org/Offer (221,781,710) http://schema.org/AggregateRating (38,398,548) http://schema.org/Review (26,209,678)	62,179 MB	schemaorgProduct.nq.gz (sample)

- Only tip of the iceberg, as each website is only partly crawled.

3. Alternative Approach: Linked Data

Extend the Web with a single global data graph

- by using RDF to publish structured data on the Web
- by setting links between data items within different data sources

Entities are identified with HTTP URIs

HTTP URIs take the role of global primary keys.

`pd:cygri` = <http://richard.cyganiak.de/foaf.rdf#cygri>

`dbpedia:Berlin` = <http://dbpedia.org/resource/Berlin>

URIs can be linked to navigate the data space

■ By following RDF links applications can

- navigate the global data graph
- discover new data sources

The Linked Open Data Cloud

1,300 datasets connected by
16,147 sets of RDF links
(as of January 2025)

Legend

Cross Domain

Geography

Government

Life Sciences

Linguistics

Media

Publications

Social Networking

User Generated

<https://lod-cloud.net/>

Uptake in the Libraries Community

■ Institutions publishing Linked Data

- Library of Congress (subject headings and catalog)
- German National Library (PND dataset and subject headings)
- Swedish National Library (Libris catalog)
- Hungarian National Library (OPAC and digital library)
- Europeana Digital Library (catalog)
- Springer Nature (publications, researchers, projects)

■ Goals:

1. Interconnect resources between repositories
(by topic, by location, by historical period, by ...)
2. Integrate library catalogs on global scale

LIBRARY OF
CONGRESS

National Library
of Sweden

Uptake in the Life Science Domain

■ Goals:

1. Connect life science datasets in order to support
 - biological knowledge discovery
 - drug development
2. Reuse results of previous integration efforts

■ Projects

BIO↔RDF

2. Web 2.0 Applications and Web APIs

- A multitude of **Web-based applications** has sprung up which enable users to share information.
- These applications
 - collect large **amounts of data** using proprietary schemata.
 - form **separate data spaces** that are only partly accessible from the Web via:
 1. HTML interfaces
 2. Web APIs

Example: Facebook

■ Users (September 2018)

- 2,3 billion monthly active users
- including 1 billion mobile users

■ 740 billion friend connections

■ 4 million likes every minute

■ 250 billion photos uploaded

■ Data Volume

- 4 Petabyte of new data generated every day
- over 300 Petabyte in Facebook's data warehouse

<https://www.brandwatch.com/blog/facebook-statistics/>

<http://www.technologyreview.com/featuredstory/428150/what-facebook-knows/>

Web APIs

- allow to access the data programmatically
- example of using the Twitter API (now X API):

```
import pandas as pd

# Search tweets
dict_ = {'user': [], 'date': [], 'text': [], 'favorite_count': []}
for status in python_tweets.search(**query)['statuses']:
    dict_['user'].append(status['user']['screen_name'])
    dict_['date'].append(status['created_at'])
    dict_['text'].append(status['text'])
    dict_['favorite_count'].append(status['favorite_count'])

# Structure data in a pandas DataFrame for easier manipulation
df = pd.DataFrame(dict_)
df.sort_values(by='favorite_count', inplace=True, ascending=False)
df.head(5)
```

■ ProgrammableWeb API Catalog

- lists over 24,000 Web APIs
- lists over 6,800 mashups
- catalog maintained until 10-2022 (alternatives below*)

■ APIs usually provide only limited access

- require registration
- restricted to specific queries (canned queries)
- restricted by amount of queries / number of results
- (try to) prevent crawling

* <https://nordicapis.com/13-api-directories-to-help-you-discover-apis/> or <https://apislist.com/>

Web APIs versus Linked Data or HTML Embedded Data

3. What is Web Mining?

■ Definition

Non-trivial extraction of implicit, previously unknown and potentially useful information from

- **Web content,**
- **Web structure**
- **Web usage data.**

■ Recurring Challenges

1. huge amount of available data → requires sampling or cloud computing
2. semi-structured nature of data → mix of data and text mining techniques
3. heterogeneity of data → data integration and cleansing is a challenge
4. distributed nature of data → often requires large-scale crawling or relying on pre-crawled web corpora

Web Mining is a Multi-Disciplinary Field

■ Draws ideas and techniques from

■ Sub-Fields

1. Web Usage Mining
2. Web Structure Mining
3. Web Content Mining

3.1 Web Usage Mining

■ Definition

Discovery of patterns in click-streams and associated data collected or generated as a result of user interactions with one or more web sites or Web 2.0 applications.

■ Typical Sources of Data

1. web server access logs
2. e-commerce and product-oriented user events (e.g., shopping cart changes, ad or product click-throughs, purchases)
3. user events on social network sites (e.g., likes, posts, comments)

■ Associated Data

1. page attributes, page content, site structure
2. additional domain knowledge and demographic data
3. user profiles or user ratings

Franz Kafka

Schriftsteller

Franz Kafka war ein deutschsprachiger Schriftsteller. Sein Hauptwerk bilden neben drei Romanfragmenten zahlreiche Erzählungen. [Wikipedia](#)

Geboren: 3. Juli 1883, [Prag](#), [Tschechien](#)

Gestorben: 3. Juni 1924, [Kierling](#), [Klosterneuburg](#), [Österreich](#)

Bestattet: 11. Juni 1924, [Neuer jüdischer Friedhof](#), [Prag](#), [Tschechien](#)

Kurzgeschichten: [Die Verwandlung](#), [Das Urteil](#), [Vor dem Gesetz](#), [MEHR](#)

Beeinflusst von: [Fjodor Michailowitsch Dostojewski](#), [MEHR](#)

3.2 Web Structure Mining

■ Definition

Discovery and interpretation of patterns in

- 1. the hyperlink structure of the Web**
- 2. the social ties among actors that interact on the Web**

■ Typical sources of Web graphs

1. Web crawls including HTML pages and hyperlinks
2. social networks including explicit relations between actors (your Facebook friend network)
3. other types of community data (discussion forums, email conversations, ...)

■ Focuses on the structure, but can of course also be combined with content or usage mining techniques

Identification of Prominent Nodes

Question: Who are the “most important” actors in a social network?

Centrality

- A **central actor** is one involved in many edges.
- The direction of lines is not considered.

Prestige

- A **prestigious actor** is one who is the target of many arcs.
- The direction of arcs is considered.

Community Detection

A **community** is a set of actors between which interactions are (relatively) frequent.

- Finding a community in a social network is to identify a set of nodes such that they interact with each other more frequently than with those nodes outside the group.

- Methods: Components, K-Cores, Islands, ...
- Applications: Recommendation based on communities, visualization of huge networks

Machine Learning with Graphs

Link Prediction: Given a snapshot of a social network, can we infer which new interactions among its members are likely to occur in the near future? (Liben-Nowell & Kleinberg, 2007)

- Facebook: recommending possible friends
- Tinder: recommending potential matches

Node Classification: Predict node properties based on other node properties as well as neighboring nodes.

- Knowledge Graph: Type of a node: e.g., person, author, athlete

3.3 Web Content Mining

■ Definition

Automatic extraction of useful information (facts, patterns) from Web content (text, images, video).

■ Content Mining Tasks

- Content Clustering
- Content Classification
- Sentiment Analysis
- Political Scaling
- Information Extraction

Content Classification

- **Goal:** Previously **unseen documents/images** should be **assigned a class** as accurately as possible.
- **Applications**
 - News categorization
 - Product categorization
 - Spam detection
- **Classification methods**
 - Naive Bayes, Support Vector Machines, Deep Neural Nets, Transformers

Content Clustering

■ **Unsupervised Learning: Given a set of documents and a similarity measure among documents find clusters such that:**

- documents in one cluster are more similar to one another
- documents in separate clusters are less similar to one another

■ Applications

- Search result clustering
- Topic discovery

■ Techniques

- Algorithms: K-Means, Hierarchical Clustering, S-BERT
- Similarity measures: Cosine, Jaccard, Similarity of Embeddings

Mixture of Document Clustering and Classification

The screenshot displays the Google News interface. At the top, there is a search bar and navigation links for 'Headlines', 'Local', 'For You', and 'U.S.'. Below the navigation bar, the 'SECTIONS' menu is visible on the left, listing various news categories: Top Stories, World, U.S., Business, Technology, Entertainment, Sports, Science, Health, and a 'Manage sections' option. The main content area is titled 'Top Stories' and features a large article about Trump's budget. This article includes a thumbnail image of food cans, a headline, a source (Washington Post), and a timestamp (2h ago). Below the main article, there is a 'RELATED COVERAGE' section with several links to related news stories, including 'Legislative Outline for Rebuilding Infrastructure in America - WhiteHouse.gov' and 'Trump plan calls for \$1.5 trillion in 'investment' to fix nation's infrastructure'. A 'MORE ABOUT' section on the left of the main article lists related topics: Donald Trump, White House, President of the United States, and United States of America. The entire content area is enclosed in a red dashed border, highlighting the mixture of document clustering and classification.

- United States of America

Sentiment Analysis

The basic task in sentiment analysis is classifying the polarity of a given text at the document, sentence, or feature/aspect level.

■ Polarity Values

- positive, neutral, negative
- stars

■ Applications

- Document-level: vote prediction from tweets
- Feature/Aspect-level: analysis of product reviews

Revolution In The Head: The Beatles Records and the Sixties (Englisch) Taschenbuch – 4. Dezember 2008
von Ian MacDonald (Autor)
★★★★☆ 175 Sternebewertungen

> Alle 3 Formate und Ausgaben anzeigen

Taschenbuch
5,69 €

Lieferung 19.-24. Febr., wenn Sie Standardversand an der Kasse wählen. [Siehe Details.](#)

18 neu ab 5,69 € | 5 gebraucht ab 3,60 €

As dazzling as the decade they dominated, The Beatles almost single-handedly created pop music as we know it. Today, their songs are cited as seminal influences by stars like Oasis and Blur. Eloquently giving voice to their time, The Beatles quite simply changed the world.

Hate Speech Detection / Political Scaling

■ Hate Speech Detection in Social Media Content

Twitter	% posts	Whisper	% posts
I hate	70.5	I hate	66.4
I can't stand	7.7	I don't like	9.1
I don't like	7.2	I can't stand	7.4
I really hate	4.9	I really hate	3.1
I fucking hate	1.8	I fucking hate	3.0
I'm sick of	0.8	I'm sick of	1.4
I cannot stand	0.7	I'm so sick of	1.0
I fuckin hate	0.6	I just hate	0.9
I just hate	0.6	I really don't like	0.8
I'm so sick of	0.6	I secretly hate	0.7

Twitter		Whisper	
Hate target	% posts	Hate target	% posts
Nigga	31.11	Black people	10.10
White people	9.76	Fake people	9.77
Fake people	5.07	Fat people	8.46
Black people	4.91	Stupid people	7.84
Stupid people	2.62	Gay people	7.06
Rude people	2.60	White people	5.62
Negative people	2.53	Racist people	3.35
Ignorant people	2.13	Ignorant people	3.10
Nigger	1.84	Rude people	2.45
Ungrateful people	1.80	Old people	2.18

■ Political Scaling of Opinionated Texts

Information Extraction

Goal: Automatic extraction of structured information from unstructured or semi-structured Web content.

- **Example of below 1NF data:**

Brand	Model	Type	Memory	Screen	OS
New Samsung	Galaxy S4	GT-19505	16GB	5.0 inches	Android
Smartphone with 2-Year Sprint Contract - White Frost					

- **The difficulty of the extraction depends on the structuredness**

Examples: Information Extraction from the Web

3.4. The Web Mining Process

Equal to the standard data mining process with the difference that data is gathered from the Web.

Gathering and Exploration

1. Gathering of Web Data

- Crawl documents or data
- Retrieve data via Web API
- Download pre-gathered data sets

2. Exploration

- Get an initial understanding of the data
- Calculate basic summarization statistics
- Visualize the data
- Identify data problems such as outliers, missing values, duplicate records, heterogeneity

Preprocessing and Transformation

- **Transform data into a representation that is suitable for the chosen data mining methods**
 - amount of data (determines hardware requirements)
 - number of dimensions (represent relevant information using less attributes)
 - scales of attributes (nominal, ordinal, numeric, embeddings)
- **Methods**
 - discretization and binarization
 - feature subset selection / dimensionality reduction
 - attribute transformation / text to term vector / embedding
 - aggregation, sampling
 - integrate data from multiple sources
- **Good data preparation is key to producing valid and reliable models**
- **Data integration and preparation is estimated to take 70-80% of the time and effort of a data mining project**

Actual Data Mining

■ Input: Preprocessed Data

■ Output: **Model / Patterns**

1. Apply data mining method

2. Evaluate resulting model / patterns

3. Iterate

- experiment with different hyperparameter settings
- experiment with multiple alternative methods
- improve preprocessing and feature generation
- increase amount or quality of the training data

Deployment

- Use model in the business context
- Keep iterating to maintain and improve model

CRISP-DM Process Model
